Predicted future cumulative traffic noise levels and increases attributable to buildout of the proposed Master Plan are summarized in Table 11. Based on the traffic noise modeling conducted, implementation of the proposed Master Plan would result in predicted increases in traffic noise levels of approximately 0.7 dBA, or less, along primarily affected area roadway segments. As noted earlier in this report, perceptible changes in ambient noise levels do not typically occur at levels below 3 dBA. Based on the modeling conducted, implementation of the proposed project would not result in a significant increase in traffic noise levels at nearby noise-sensitive land uses. As a result, predicted increases in future cumulative traffic noise levels associated with buildout of the proposed project would be considered less than significant.

#### Non-Transportation Noise Sources

Noise sources commonly associated with medical facilities can include occasional parking lot activities (e.g., opening and closing of vehicle doors, people talking), and use of onsite building equipment, such as HVAC systems, boilers, and power generators. Building equipment is typically located within a central plant or located on rooftops. Noise levels associated with these noise sources for both the proposed 10-year expansion plan and the 25-year Master Plan are discussed separately, as follows:

#### Parking Structure

The proposed project would include construction of an approximate 677-space multi-story parking structure. The parking structure would be located northeast of the existing medical center, approximately 1,000 feet north of Herndon Avenue. The nearest residential dwellings are located approximately 725 feet to the east. As previously discussed, noise levels commonly associated with vehicle parking areas are often associated with the starting of vehicles, the opening and closing of vehicle doors, playing of amplified music, and the occasional sound of vehicle alarms and horns. Noise levels associated with large parking structures can reach levels of approximately 92 dBA SEL at 50 feet (FTA 2006.)

**Table 11**  
**Predicted Increases in Traffic Noise Levels**  
**Future Cumulative Year 2035 Conditions**

| Roadway  | Predicted CNEL, 50 Feet from Near-Travel Lane Centerline |                       | Predicted Increase | Significant Increase? |
|--|--|-----------------------|--------------------|-----------------------|
|  | Without Project  | With Project Buildout |                    |                       |
| Herndon Avenue, Armstrong Avenue to Tollhouse Road   | 69.5   | 69.8                  | 0.3                | No                    |
| Herndon Avenue, Tollhouse Road to Temperance Avenue  | 70.0   | 70.3                  | 0.3                | No                    |
| Herndon Avenue, Temperance Avenue to Coventry Avenue   | 70.2   | 70.9                  | 0.7                | No                    |
| Herndon Avenue, Coventry Avenue to CCMC Access Road  | 70.8   | 71.1                  | 0.3                | No                    |
| Herndon Avenue, CCMC Access Road to Locan Avenue   | 70.8   | 71.1                  | 0.3                | No                    |
| Herndon Avenue, Locan Avenue to De Wolf Avenue   | 71.8   | 71.9                  | 0.1                | No                    |
| Herndon Avenue, De Wolf Avenue (DL) to De Wolf Avenue (SL)   | 71.6   | 71.7                  | 0.1                | No                    |
| Herndon Avenue, De Wolf Avenue (SL) to Leonard Avenue  | 71.0   | 71.1                  | 0.1                | No                    |
| Locan Avenue, Herndon Avenue to Bullard Avenue   | 70.8   | 71.2                  | 0.4                | No                    |
| <i>Traffic noise levels were calculated using the FHWA roadway noise prediction model (FHWA-RD-77-108) based on data obtained from the traffic analysis prepared for this project.</i> |  |                       |                    |                       |

Parking structure noise levels were calculated assuming that all vehicles parking spaces would be accessed within a one-hour period. Based on this assumption, peak-hour noise levels associated with the proposed parking structure would be 59 dBA  $L_{eq}$  at 50 feet. Predicted peak-hour noise levels at the nearest residential land use located to the east of the proposed parking structure would be approximately 30 dBA  $L_{eq}$ . Predicted average-daily noise levels at this nearest residence would be approximately 37 dBA CNEL, or less. Predicted noise levels at other offsite noise sensitive receptors located south of Herndon Avenue would be less than 25 dBA CNEL. Predicted noise levels at nearby land uses would not exceed the City's exterior or interior noise standards of 65 and 45 dBA CNEL, respectively, and would be largely masked by ambient noise levels. This impact is considered less than significant.

#### Parking Lots

The proposed project would include construction of surface parking lots to serve proposed development, including the proposed hotel, shopping centers, medical-office buildings, and assisted living facility. Based on the traffic analysis prepared for this project, these proposed land uses would generate a maximum of approximately 100 vehicle trips during the peak-hour. Based on this traffic volume, parking lots associated with the proposed land uses would generate peak-hour noise levels of approximately 25 dBA  $L_{eq}$ , or less. Proposed parking lots would be largely shielded from direct exposure of nearby sensitive land uses and resultant noise levels would be largely masked by ambient traffic noise levels. Furthermore, operational noise levels would typically be limited to the daytime hours. Predicted operational noise levels at nearby sensitive land uses would not exceed the City's exterior or interior noise standards of 65 and 45 dBA CNEL, respectively. This impact is considered less than significant.

#### Central Plant Expansion

Phase II of the proposed project would include expansion of the central plant. As part of the expansion, a new central plant would be constructed and centrally located within the eastern portion of the site. Building and equipment specifications for the future plant expansion have not yet been identified. However, potential noise-generating equipment associated with central plant would be anticipated to include chillers, boilers, and emergency-use power generators. Up to three emergency generators would likely be installed. Noise levels associated with chillers and boilers can reach levels of approximately 85 dBA

$L_{eq}$  at 3 feet. Based on manufacturer's technical data, noise levels associated with the generators would be approximately 89 dBA  $L_{eq}$  at 50 feet (Caterpillar 2008.)

The nearest residential land uses are located approximately 375 feet east of the proposed central plant. Based on the operational noise levels discussed above, and assuming a minimum noise reduction of 15 dB for the building enclosure, predicted operational noise levels at the property line of the nearest residential land uses would be approximately 35 dBA  $L_{eq}$  during normal plant operations. During periods when operation of the emergency generators would be required, predicted noise levels at the nearest residential land uses would be approximately 61 dBA  $L_{eq}$ . Assuming that all equipment were to operate continuously over a 24-hour period, predicted maximum exterior noise levels at the nearest residential land uses would be approximately 72 dBA CNEL. Based on this noise level and assuming an average exterior-to-interior noise reduction of 20 dBA, predicted interior noise levels at the nearest residential dwellings would be approximately 52 dBA CNEL.

Predicted operational noise levels at the nearest residential land uses located east of the medical center could potentially exceed the City's exterior or interior noise standards of 65 dBA and 45 dBA CNEL, respectively. Given increased distance from the source and shielding provided by intervening structures, predicted noise levels at noise-sensitive receptors located south of Herndon Avenue, including Cedarwood Elementary School, would not exceed applicable noise standards. This impact would be considered potentially significant.

#### Building Mechanical Equipment

The proposed project includes construction of commercial buildings generally located along Herndon Avenue, to the west and south of the existing medical center and adjacent to existing residential land uses. In addition to adjacent residential land uses, nearby noise-sensitive land uses also includes Cedarwood Elementary School, which is located south of Herndon Avenue, approximately 230 feet south of proposed assisted living facility.

Noise-generating building mechanical equipment associated with commercial-use buildings would be primarily associated with the operation of exterior air conditioning units, which are generally limited to the daytime hours of operation. Noise levels associated with larger commercial-use air conditioning systems can reach levels of up to approximately 78 dBA at 3 feet (Lennox 2017). Assuming that HVAC units were to be located at ground level and within approximately 30 feet of nearby residential land uses, operational noise levels at the nearest residential land uses would be approximately 58 dBA  $L_{eq}$ . Assuming that the air conditioning units were to run continuously over a 24-hour period, predicted average-daily noise levels at the residential land uses located within approximately 30 feet could potentially exceed the City's exterior noise standard of 65 dBA CNEL. Based on these same assumptions, predicted operational noise levels at Cedarwood Elementary School would be approximately 46 dBA CNEL, would not exceed the City's noise standards, and would be largely masked by ambient noise levels. Because predicted operational noise levels at residential land uses located within 30 feet of proposed commercial development could potentially exceed the City's noise standards, this impact would be considered potentially significant.

#### Herndon Avenue Widening

The proposed project would also include the widening of the current five-lane Herndon Avenue between Temperance and Coventry Avenues to six lanes and widen the roadway between Coventry and the southern leg of DeWolf Avenue from two lanes to a four-lane divided roadway. Site plans and alignments for the proposed widened segments of Herndon Avenue have not yet been developed. Based on traffic noise modeling conducted for similar projects and depending on the final alignment and distances to nearby noise sensitive receptors, predicted traffic noise levels could potentially exceed the City's noise standards. Depending on changes in distance from roadway travel lanes to receptors, significant increases in traffic noise levels may also occur. As a result, exposure to traffic noise levels associated with the future widening of Herndon Avenue would be considered to have a potentially significant impact.

## **Mitigation Measures**

### **Mitigation Measure Noise-2: Implement Noise Control Measures to Reduce Long-term Noise Impacts.**

- a. An acoustical analysis shall be prepared for the proposed central plant prior to final design. The acoustical analysis shall identify building/equipment noise-reduction measures to be incorporated sufficient to achieve an exterior average-hourly noise-level of 50 dBA  $L_{eq}$ , or less, at the property line of the nearest noise-sensitive land use. This average-hourly noise levels performance standard would equate to an average-daily noise level of approximately 58 dBA CNEL, which would ensure compliance with the City of Clovis exterior and interior noise level standards of 65 and 45 dBA CNEL, respectively. Noise-reduction measures to be incorporated may include, but are not limited to, the selection of alternative or quieter equipment, use of sound enclosures, and shielding building intake and exhaust vents from direct line of sight of nearby noise-sensitive land uses. The acoustical analysis shall be submitted to the City of Clovis Planning Department for review and approval prior to issuance of construction/grading permits for the construction of the central plant.
- b. Emergency generators shall be enclosed and fitted with exhaust silencers.
- c. Building air conditioning units for proposed structures shall be located on building rooftops and shielded from direct line-of-sight of adjacent noise-sensitive land uses. Building parapets shall be constructed, when necessary, to shield nearby land uses from direct line-of-site of air conditioning units.
- d. An acoustical analysis shall be prepared for the planned future widening of Herndon Avenue. The acoustical analysis shall evaluate changes in traffic noise levels that would result from the proposed widening in comparison to the City of Clovis General Plan noise standards (refer to Table 3). Noise-reduction measures (e.g., sound walls) shall be evaluated, where practical, to reduce traffic noise levels to below applicable noise standards. The acoustical analysis shall be submitted to the City of Clovis Planning Department for review and approval prior to issuance of construction/grading permits.

### **Level of Significance after Mitigation**

Implementation of Mitigation Measure Noise-2,a would require that acoustical assessments be prepared for the proposed future central plant expansion and future widening of Herndon Road, once more detailed information becomes available and prior to construction. The assessments would be required to meet the City of Clovis noise performance standards and, where necessary, incorporate noise-reduction measures to achieve these standards. Mitigation Measure Noise-2,b would require the installation of exhaust silencers for newly installed emergency generators, which would reduce exhaust noise by a minimum of approximately 15 dB. Mitigation Measure Noise-2,c would require building air conditioning units to be located on rooftop areas and shielded from direct line-of-sight of nearby noise-sensitive land uses. The shielding of building air conditioning units from direct line of sight would reduce operational noise levels at nearby land uses by approximately 5 to 10 dBA. With mitigation, non-transportation noise levels would not exceed City of Clovis noise standards.

Mitigation Measure Noise-2,d would require the preparation of an acoustical analysis for the planned future widening of Herndon Avenue, once more detailed site plans become available. The acoustical analysis would be required to evaluate changes in traffic noise levels in comparison to the City of Clovis General Plan noise standards and, where practical, noise-reduction measures (e.g., sound walls). However, in some instances, the feasibility of noise-reduction measures, such as sound walls, may not be practical. As a result, increases in traffic noise associated with the future widening of Herndon Avenue would be considered significant and unavoidable.

**Impact Noise-3**

**Would the project result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?**

No major stationary sources of groundborne vibration were identified in the project area that would result in the long-term exposure of proposed onsite land uses to unacceptable levels of ground vibration. In addition, the proposed project would not involve the use of any major equipment or processes that would result in potentially significant levels of ground vibration that would exceed these standards at nearby existing land uses. However, construction activities associated with the proposed project would require the use of various tractors, trucks, and jackhammers that could result in intermittent increases in groundborne vibration levels. The use of major groundborne vibration-generating construction equipment/processes (i.e., blasting, pile driving) is not anticipated to be required for construction of future onsite land uses.

Groundborne vibration levels commonly associated with construction equipment are summarized in Table 12. As identified, groundborne vibration levels generated by construction equipment would be approximately 0.09 in/sec ppv, or less, at 25 feet. Predicted groundborne vibration levels would not be anticipated to exceed recommended criteria for structural damage and human annoyance (0.2 and 0.1 in/sec ppv, respectively) at nearby land uses. As a result, short-term groundborne vibration impacts would be considered less than significant.

**Table 12**  
**Representative Vibration Source Levels for Construction Equipment**

| Equipment                              | Peak Particle Velocity at 25 Feet (In/Sec) |
|--|--|
| Large Bulldozers                       | 0.089                                      |
| Loaded Trucks                          | 0.076                                      |
| Jackhammer                             | 0.035                                      |
| Small Bulldozers                       | 0.003                                      |
| <i>Source: FTA 2006, Caltrans 2013</i> |  |

**Impact Noise-4:**

**Would the project result in the exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?**

Non-Transportation Noise

As discussed in Impact Noise-3, the proposed project would result in increased non-transportation noise levels at nearby noise-sensitive land uses that would exceed the City of Clovis General Plan noise standards. Short-term construction related activities would also be projected to exceed commonly applied noise criteria. As a result, exposure to non-transportation noise levels generated by the proposed project would be considered to have a *potentially significant impact*. (Refer to Impact Noise-2 and Noise-3 for additional discussion of short-term and long-term noise impacts associated with the proposed project.)

Transportation Noise

The City of Clovis General Plan includes land use compatibility noise standards for newly proposed land uses. As depicted in Table 3, the City's "normally compatible" exterior and interior noise standards for residential and school land uses is 65 and 45 dBA CNEL respectively. For newly proposed land uses, hospitals are considered "normally compatible" within exterior noise environments up to 65 dBA CNEL, offices are considered "normally compatible" up to 75 dBA CNEL, commercial uses are considered "normally compatible" up to 80 dBA CNEL, and residential land uses and hotels are considered "normally compatible" up to 70 dBA CNEL.

### *Roadway Traffic*

Based on the traffic noise modeling conducted for future cumulative year 2035 conditions, predicted exterior traffic noise levels along the adjacent segments of Herndon Avenue, in the vicinity of the proposed land uses, would range from approximately 70 to 71 dBA CNEL at 50 feet from the roadway centerline. Assuming a minimum setback distance of approximately 75 feet from the centerline of adjacent roadway segments, predicted exterior traffic noise levels would be approximately 68 dBA CNEL, or less, at the nearest proposed commercial, medical-dental office buildings. Predicted exterior traffic noise levels at the proposed assisted living facility would be approximately 66 dBA CNEL. Existing average-daily volumes along Highway 168 currently average approximately 16,000/day with trucks constituting roughly eight percent of the roadway volume (Caltrans 2017). By year 2035, traffic volumes along Highway 168 are projected to increase to roughly 44,000 vehicles/day (Caltrans 2015). Based on this estimate, predicted future average-daily noise level for Highway 168 would be approximately 76 dBA CNEL at 50 feet from the near-travel-lane centerline. Predicted future traffic noise levels at the proposed cancer center and commercial land uses located near the northern boundary of the project site would be approximately 65 and 67 dBA CNEL, respectively. Predicted future traffic noise levels at these land uses would not exceed the City's respective "normally compatible" noise standards of 75 dBA CNEL for offices, or 80 dBA CNEL for commercial uses. Predicted traffic noise levels at other proposed onsite land uses would be approximately 60 dBA CNEL, or less.

Predicted future cumulative traffic noise levels at proposed land uses would not exceed the City of Clovis "normally compatible" noise standards. As a result, the compatibility of proposed land uses in comparison to future traffic noise levels would be considered to have a less-than-significant impact.

As noted in Impact Noise-2, the project would also widen the current five-lane Herndon Avenue between Temperance and Coventry Avenues to six lanes and widen the roadway between Coventry and the southern leg of DeWolf Avenue from two lanes to a four-lane divided roadway. Site plans and alignments for the proposed widened segments of Herndon Avenue have not yet been developed. Based on traffic noise modeling conducted for similar projects and depending on the final alignment and distances to nearby noise sensitive receptors, predicted traffic noise levels could potentially exceed the City's noise standards. Depending on changes in distance from roadway travel lanes to receptors, significant increases in traffic noise levels may also occur. As a result, exposure to traffic noise levels associated with the future widening of Herndon Avenue would be considered to have a potentially significant impact.

### *On-Site Helistop Noise*

The proposed project would not include changes that would affect onsite helistop operations or require the relocation of the existing helistop. Helistop noise levels were evaluated in the previously prepared Clovis Community Medical Center Master Plan. Based on the analysis previously prepared, the projected 60 dBA and 65 dBA CNEL operational noise contours for the helistop would extend approximately 550 and 260 feet from the center of the landing pad, respectively. Proposed new land uses located within the projected 60 dBA CNEL contour would include the proposed central plant, general services building, and future expansion of the acute care unit, located along the eastern side of the existing medical center. Predicted helistop noise levels at the central plant and general services buildings would not exceed the City's exterior noise standard of 80 dBA CNEL for similar land uses (e.g., maintenance, manufacturing, utility uses). Predicted exterior noise levels at the proposed acute care unit would be approximately 67 dBA. The acute care unit would be a transient use and would not include long-term care of patients, similar to that of a medical office. In accordance with the City's noise standards, offices are considered "normally compatible" up to 75 dBA CNEL. Predicted helistop noise levels at other proposed land uses would be less than 60 dBA CNEL and would not exceed the City's noise standards. For these reasons, exposure to helistop noise levels would be considered less than significant.

### **Mitigation Measures**

Implement Mitigation Measures Noise-2,a – 2,d.

### **Level of Significance after Mitigation**

Implementation of Mitigation Measure Noise-2,a would require that acoustical assessments be prepared for the proposed future central plant expansion and future widening of Herndon Road, once more detailed information becomes available and prior to construction. The assessments would be required to meet the City of Clovis noise performance standards and, where necessary, incorporate noise-reduction measures to achieve these standards. Mitigation Measure Noise-2,b would require the installation of exhaust silencers for newly installed emergency generators, which would reduce exhaust noise by a minimum of approximately 15 dB. Mitigation Measure Noise-2,c would require building air conditioning units to be located on rooftop areas and shielded from direct line-of-sight of nearby noise-sensitive land uses. The shielding of building air conditioning units from direct line of sight would reduce operational noise levels at nearby land uses by approximately 5 to 10 dBA. With mitigation, non-transportation noise levels would not exceed City of Clovis noise standards and would be considered to have a less-than-significant impact.

Mitigation Measure Noise-2,d would require the preparation of an acoustical analysis for the planned future widening of Herndon Avenue, once more detailed site plans become available. The acoustical analysis would be required to evaluate changes in traffic noise levels in comparison to the City of Clovis General Plan noise standards and, where practical, noise-reduction measures (e.g., sound walls). However, in some instances, the feasibility of noise-reduction measures, such as sound walls, may not be practical. As a result, increases in traffic noise associated with the future widening of Herndon Avenue would be considered significant and unavoidable.

## **CUMULATIVE SETTING AND IMPACTS**

### **CUMULATIVE SETTING**

The geographic extent of the cumulative setting for noise consists of the project area and the surrounding areas within the City. Cumulative development conditions would result in increased cumulative roadway noise levels, and would also result in increased noise associated with future development. As noted earlier in this report, ambient noise levels in the project area are influenced primarily by traffic noise emanating from area roadways. No major stationary sources of noise have been identified in the project area. The primary factor for cumulative noise impact analysis is the consideration of future traffic noise levels.

### **CUMULATIVE IMPACTS**

#### **Contribution to Cumulative Noise Levels**

**Impact Noise-5:     *Would the project result in a significant contribution to cumulative noise levels at nearby land uses?***

Future cumulative traffic noise levels, with and without implementation of the proposed project, were calculated using the FHWA roadway noise prediction model (FHWA-RD-77-108) based on California vehicle reference noise levels and traffic data obtained from the traffic analysis prepared for this project. The project's contribution to the cumulative traffic noise levels along area roadways was determined by comparing the predicted noise levels with and without project-generated traffic under cumulative conditions. Based on the modeling conducted, predicted increases in traffic noise levels under future cumulative conditions, with construction of the proposed land uses, would be approximately 0.7 dBA CNEL, or less (refer to Table 11). Development of the proposed land uses would not contribute to significant increases in traffic noise levels at sensitive land uses located along primarily affected area roadways. However, as noted in Impact Noise-4, the widening of Herndon Avenue may result in significant increases in traffic noise levels at some nearby existing noise-sensitive land uses depending on final design. As a result, this impact would be considered potentially significant.

**Mitigation Measures**

Implement Mitigation Measure Noise-2.d.

**Level of Significance after Mitigation**

Mitigation Measure Noise-2,d would require the preparation of an acoustical analysis for the planned future widening of Herndon Avenue, once more detailed site plans become available. The acoustical analysis would be required to evaluate changes in traffic noise levels in comparison to the City of Clovis General Plan noise standards and, where practical, noise-reduction measures (e.g., sound walls). However, in some instances, the feasibility of noise-reduction measures, such as sound walls, may not be practical. As a result, increases in traffic noise associated with the future widening of Herndon Avenue would be considered significant and unavoidable.

## Introduction and Summary

### Introduction

This report describes a Traffic Impact Analysis (TIA) prepared by JLB Traffic Engineering, Inc. (JLB) for the proposed Master Plan Expansion of the Clovis Community Medical Center located at Herndon Avenue and Temperance Avenue in the City of Clovis. The proposed Project to be evaluated includes two components. Per information provided to JLB, both of the Project components are consistent with the City of Clovis General Plan. Figure 1 shows the location of the proposed Project site relative to the surrounding roadway network.

The first component is the proposed expansion plan of the Clovis Community Medical Center (CCMC), which is a phased project over the next 20 years. The CCMC Project includes the construction of new inpatient bed towers, medical office buildings, a general support building, a cancer center, a central plant, and a parking garage along with the expansion of the emergency department, surgical facilities, materials management and outpatient community center. In addition, the CCMC Project includes the potential development of areas adjacent to the main campus, primarily with retail commercial buildings as well as a hotel and an assisted living center.

The second component, the Herndon Avenue Project, is the proposed widening of Herndon Avenue from Temperance Avenue to De Wolf Avenue (south leg). Herndon Avenue will be widened to six lanes between Temperance Avenue and Coventry Avenue and four lanes between Coventry Avenue and the south leg of De Wolf Avenue. As needed, existing traffic signals within the Herndon Avenue Project will be modified to accommodate the proposed lane geometrics.

The purpose of this TIA is to evaluate the potential traffic impacts, identify short-term and long-term roadway and circulation needs, determine potential mitigation measures, and identify any critical traffic issues that should be addressed in the on-going planning process as required by CEQA. The study primarily focused on evaluating traffic conditions at study intersections, segments, and interchanges that may be impacted by the proposed Project. The scope of work was prepared via consultation with the City of Clovis, City of Fresno, County of Fresno, and Caltrans staff.

### Summary

The potential traffic impacts of the proposed project were evaluated in accordance with the standards set forth by the level of service (LOS) policies of the owner agency of the study facility.

#### *Existing Traffic Conditions*

- Except for the intersection of SR 168 EB Ramps at Temperance Avenue, all study intersections operate at an acceptable LOS during both the AM and PM peak hours. To improve the LOS at this intersection, it is recommended that a second eastbound left-turn lane be added and that the existing traffic signal be modified to accommodate the added lane.
- Under this scenario, all study segments operate at an acceptable LOS.

### *Existing plus Project Phase 1 Traffic Conditions*

- By this scenario, it is assumed that widening of Herndon Avenue between Temperance Avenue and the south leg of De Wolf Avenue has been completed.
- The Phase 1 of the CCMC (Year 2026) consists of adding a 300,172 square-foot expansion of the existing hospital, 94,392 square feet of Medical Dental Office Building, 150,000 square feet of Shopping Center, and a 150 room Hotel.
- Phase 1 of the CCMC is estimated to generate a maximum of 15,121 daily trips, 756 AM peak hour trips and 1,278 PM peak hour trips.
- Similar to the previous scenario, except for the intersection of SR 168 EB Ramps at Temperance Avenue, all study intersections are projected to operate at an acceptable LOS during both the AM and PM peak hours. To improve the LOS at this intersection, it is recommended that a second eastbound right-turn lane and third northbound thru lane be added and that the existing traffic signal be modified to accommodate the added lane geometrics.
- Under this scenario, all study segments are projected to operate at an acceptable LOS.

### *Near Term plus Project Phase 1 Traffic Conditions*

- The near term projects are estimated to generate 45,938 daily trips, 4,655 AM peak hour trips and 5,267 PM peak hour trips.
- Under this scenario, except for the intersections of SR 168 EB Ramps at Temperance Avenue, Herndon Avenue at Temperance Avenue, and Herndon Avenue at De Wolf Avenue (south leg), all intersections are projected to operate at acceptable LOS during both the AM and PM peak hours. To improve the LOS at each one of the intersections projected to exceed its LOS threshold, it is recommended that the improvement measures recommended under the Existing plus Project Phase 1 Traffic Conditions scenario be implemented along with the following.
  - Herndon Avenue at Temperance Avenue
    - Implement overlap phasing of the westbound right-turn with the southbound left-turn phase
    - Prohibit southbound to northbound U-turns
  - Herndon Avenue at De Wolf Avenue (south leg)
    - Implement All-Way STOP traffic controls
- Of the near term projects, the CCMC Phase 1 Project accounts for only 24.8, 14.0, and 19.5 percent of the total near term project traffic for the daily, AM and PM peak hours, respectively. Therefore, it can be deduced that the mitigation measures presented under this scenario may not be necessary immediately upon completion of the proposed Project.
- Under this scenario, all study segments are projected to operate at an acceptable LOS.

### *Cumulative Year 2035 No Project Traffic Conditions*

- Under this scenario, several of the study intersections are expected to exceed their respective LOS thresholds. These include the intersections of SR 168 EB Ramps at Temperance Avenue, Herndon Avenue at Armstrong Avenue, Herndon Avenue at Temperance Avenue, Herndon Avenue at Locan Avenue, Herndon Avenue at De Wolf Avenue (north leg), Herndon Avenue at De Wolf Avenue (south leg), Herndon Avenue at Leonard Avenue, Herndon Avenue at McCall Avenue, Herndon Avenue at Academy Avenue, Bullard Avenue at Locan Avenue, and Bullard Avenue at De Wolf Avenue. To improve the LOS at each one of the intersections, various mitigation measures are recommended including but not limited to signalization, addition of lanes, All-Way STOP controls, signalization and coordination, and signal phasing setups. Specific recommendations are explained in detail under the Cumulative Year 2035 No Project Traffic Conditions scenario and are further illustrated in Figure 9.
- Under this scenario, all study segments are projected to operate at an acceptable LOS.

### *Cumulative Year 2035 plus Project Traffic Conditions*

- Phase 2 of the CCMC is estimated to generate a maximum of 14,887 daily trips, 866 AM peak hour trips and 1,374 PM peak hour trips. Therefore Phase 1 and Phase 2 of the CCMC Project are estimated to generate a combined maximum of 30,008 daily trips, 1,622 AM peak hour trips and 2,652 PM peak hour trips.
- Similar to the Cumulative Year 2035 No Project, under this scenario, the intersections of SR 168 EB Ramps at Temperance Avenue, Herndon Avenue at Armstrong Avenue, Herndon Avenue at Temperance Avenue, Herndon Avenue at Locan Avenue, Herndon Avenue at De Wolf Avenue (NL), Herndon Avenue at De Wolf Avenue (SL), Herndon Avenue at Leonard Avenue, Herndon Avenue at McCall Avenue, Herndon Avenue at Academy Avenue, Bullard Avenue at Locan Avenue, and Bullard Avenue at De Wolf Avenue are projected to exceed their respective LOS threshold. For these intersections, it is recommended that the same improvements presented in the Cumulative 2035 No Project Scenario be implemented.
- Further, the intersections of Fir Avenue at Temperance Avenue and Herndon Avenue at Tollhouse Road are also projected to exceed their respective LOS threshold. To improve the LOS at these intersections, various mitigation measures are recommended. These recommendations include but are not limited to All-Way STOP controls, signalization, addition of lanes, signal coordination, specialized signal operations, and phasing setups. Specific mitigation measures are explained in detail in the Cumulative Year 2035 plus Project Traffic Conditions scenario and are further illustrated in Figure 12.
- Finally, the intersection of the New Temperance Access Road at Temperance Avenue is projected to exceed its LOS threshold. However, since this intersection is not projected to meet All-Way STOP or traffic signal warrants, the deficient LOS would be considered adverse but not significant and therefore mitigation measures are not recommended.
- Under this scenario, all study segments are projected to operate at an acceptable LOS.

### *Queuing Analysis*

- It is recommended that the City consider left- and right-turn lane storage lengths as indicated in Table XV.

### *Project Equitable Fair Share Impact Analysis*

- It is recommended that the Project contribute its equitable fair share towards future transportation improvements as presented in Table XVI.

## TIA Scope of Work

The study focused on evaluating traffic conditions at the existing and proposed study intersections and segments that may potentially be impacted by the proposed Project. On September 20, 2016, a draft scope of work for the preparation of a traffic impact analysis for this Project was provided to the City of Clovis, City of Fresno, County of Fresno, and Caltrans staff. On September 30, 2016, the City of Clovis approved the scope of work subject to the inclusion of the proposed right-in right-out access to Temperance Avenue. On October 11, 2016, the County of Fresno requested a trip distribution assignment for their final review of the TIA scope of work. On December 19, 2016, JLB provided the Project's trip distribution assignment to the City of Clovis, City of Fresno, County of Fresno, and Caltrans staff. Based on the Project's trip distribution assignment, the County of Fresno approved the scope of work subject to the inclusion of the intersections of Bullard Avenue at Locan Avenue and Bullard Avenue at De Wolf Avenue and the segment of Locan Avenue between Herndon Avenue and Bullard Avenue. On October 12, 2016, Caltrans approved the TIA scope of work as presented. On January 9, 2017, the City of Fresno approved the TIA scope of work as presented. Based on the comments received, this study includes in the analysis the additional intersections and segment requested by the City of Clovis and County of Fresno.

## Study Facilities

The study focused on evaluating traffic conditions at the existing study intersections and segments that may potentially be impacted by the proposed Project. The existing AM and PM peak hour turning movement counts were conducted at the study intersections in December of 2015 and throughout 2016. With the exception of the intersections of Bullard Avenue at Locan Avenue and Bullard Avenue at De Wolf Avenue and the segment of Locan Avenue between Herndon Avenue and Bullard Avenue, new traffic counts were collected in December 2015 or in 2016. The exceptions were a result of existing roadways being under construction. For those, existing traffic counts from 2009 were expanded by an annual growth rate of 4.3 percent to derive at the Base Year 2016 volumes. The 4.3 percent annual growth rate was determined between the Base Year 2016 and Cumulative Year 2035 No Project Model runs for the roadway network in the vicinity of Bullard Avenue and Locan Avenue. New existing traffic counts for the existing study intersections and segments are contained in Appendix C. The existing turning movement volumes, intersection geometrics, and traffic controls are illustrated in Figure 2. Traffic volumes were adjusted upward to balance the difference between study intersections along Temperance Avenue and Medical Center Drive.

## Study Scenarios

### *Existing Traffic Conditions*

This scenario evaluates existing traffic volumes and roadway conditions based on year 2016 traffic volumes.

### *Existing plus Project Phase 1 Traffic Conditions*

This scenario evaluates total traffic volumes and roadway conditions based on the addition of the Ten-Year Expansion Plan (Phase 1) traffic to the previous scenario. The Project Phase 1 trips to the study intersections were based on JLB's knowledge of the existing roadway network, engineering judgement, residential and commercial densities, and the City of Clovis Circulation Element in the vicinity of the Project.

### *Near Term plus Project Phase 1 Traffic Conditions*

This scenario evaluates total traffic volumes and roadway conditions based on the addition of the Near Term traffic to the previous scenario. To derive at the Near Term plus Project Phase 1 traffic volumes, this scenario expands the traffic volumes in the Existing plus Project Phase 1 scenario by adding the Near Term related trips.

### *Cumulative Year 2035 No Project Traffic Conditions*

This scenario evaluates total traffic volumes and roadway conditions based on the Cumulative Year 2035 without the proposed Project. The Cumulative Year 2035 No Project traffic volumes were obtained by subtracting the Project build-out trips from the Cumulative Year 2035 plus Project scenario.

### *Cumulative Year 2035 plus Project Traffic Conditions*

This scenario evaluates total traffic volumes and roadway conditions based on the Cumulative Year 2035 with the proposed Project. The Cumulative Year 2035 plus Project traffic volumes were obtained from the Fresno COG traffic model runs (Base Year 2016 and the Cumulative Year 2035 plus Project) and existing traffic counts. Under this scenario, the increment method as recommended by the Model Steering Committee was utilized to determine the Cumulative Year 2035 plus Project traffic volumes. The Fresno COG Traffic Model runs are contained in Appendix D.

## Level of Service Analysis Methodology

Level of Service (LOS) is a qualitative index of the performance of an element of the transportation system. LOS is a rating scale running from "A" to "F", with "A" indicating no congestion of any kind and "F" indicating unacceptable congestion and delays. LOS in this study describes the operating conditions for signalized and unsignalized intersections.

The 2010 *Highway Capacity Manual* (HCM) is the standard reference published by the Transportation Research Board and contains the specific criteria and methods to be used in assessing LOS. U-turn movements were analyzed using HCM 2000 methodologies and would yield more accurate results for the reason that HCM 2010 methodologies do not allow the analysis of U-turns. Synchro software was used to define LOS in this study. Details regarding these calculations are included in Appendix A.

A traffic impact is considered significant if it renders an unacceptable LOS on an intersection or street segment, or if it worsens an already unacceptable LOS condition on an intersection or street segment. At unsignalized intersections, a traffic impact would be considered “adverse but not significant” if the LOS standard is exceeded but the projected traffic does not satisfy traffic signal warrants. Under these conditions, the typical means to completely alleviate delays to stop controlled vehicles would be to install a traffic signal. However, the unmet signal warrants would imply that the reduction in delay for the stop-controlled vehicles may not justify new delays that would be incurred by the major street traffic (which is currently not stopped). Under these circumstances, the installation of a traffic signal would not be recommended and the substandard LOS for stop-controlled vehicles would be considered “adverse but not significant” impact.

## Criteria of Significance

The 2035 Clovis General Plan has established LOS D as the acceptable LOS threshold on its major streets. Therefore, LOS D threshold was utilized to evaluate the potential significance of LOS impacts to City of Clovis roadway facilities.

The County of Fresno has established LOS C as the acceptable level of traffic congestion on county roads and streets that fall entirely outside the Sphere of Influence (SOI) of a City. For those areas that fall within the SOI of a City, the LOS criteria of the City are the criteria of significance used in this report. LOS C is used to evaluate the potential significance of LOS impacts to Fresno County intersections and segments that fall outside the City of Clovis SOI. With a few exceptions, most the study intersections and segments are within the City of Clovis SOI, and therefore the City of Clovis LOS threshold was utilized. The exceptions are the intersections of Herndon Avenue at De Wolf Avenue (south leg), Herndon Avenue at Leonard Avenue, and Herndon Avenue at Academy Avenue and the segments of Herndon Avenue between the De Wolf Avenue (north leg) and De Wolf Avenue (south leg) and Herndon Avenue between De Wolf Avenue (south leg) and Leonard Avenue. For these exceptions, the County of Fresno LOS C threshold was utilized.

Caltrans endeavors to maintain a target LOS at the transition between LOS C and D on State highway facilities consistent with the *Caltrans Guide for the Preparation of Traffic Impact Studies* dated December 2002. However, Caltrans acknowledges that this may not always be feasible and recommends that the lead agency consult with Caltrans to determine the appropriate target LOS. In this TIA, all study intersections and segments operated by Caltrans utilized LOS C threshold to evaluate the potential significance of impacts to the roadway facilities.

## Operational Analysis Assumptions and Defaults

The following operational analysis values, assumptions and defaults were used in this study to ensure a consistent analysis of LOS among the various scenarios.

- Yellow time consistent with the California Manual of Uniform Traffic Control Devices (CA MUTCD) based on approach speeds
- All-red clearance intervals of 1.0 second for all phases
- Walk intervals of 7.0 seconds
- Flashing Don't Walk based on 3.5 feet/second walking speed with yellow plus all-red clearance subtracted
- All new or modified signals utilize protected left-turn phasing
- At existing intersections, the observed Peak Hour Factor (PHF) is utilized in the Existing, Existing plus Project Phase 1 and Near Term plus Project build-out scenarios
- A PHF of 0.92 (or the Existing PHF if higher) is utilized in the Cumulative 2035 No Project and Cumulative 2035 plus Project scenarios
- New proposed study facilities utilize a PHF of 0.92 as recommended by the Highway Capacity Manual
- A 3 percent heavy vehicle factor
- An average of 3 pedestrian calls per hour at signalized intersections

## Existing Traffic Conditions

### Roadway Network

The Project site and surrounding study area are illustrated in Figure 1. Important roadways serving the Project site are discussed below.

**State Route (SR) 168** is an existing four-lane freeway in the vicinity of the proposed Project site. For regional travel, the City of Clovis relies primarily on SR 168 as it connects the City of Clovis to the City of Fresno on the south. SR 168 continues onto SR 180 south of its interchange with McKinley Avenue and later connects to SR 41.

**Nees Avenue** is an existing east-west two- to four-lane roadway in the vicinity of the proposed Project site. Nees Avenue is a four-lane divided arterial from the western Clovis city limits at Willow Avenue to its intersection with Temperance Avenue and a two-lane collector that extends approximately one and a half miles east of Temperance Avenue. The 2035 Clovis General Plan Circulation Element designates Nees Avenue as an arterial west of Locan Avenue and a rural collector between Tollhouse Road and Thompson Avenue within the City of Clovis.

**Alluvial Avenue** is an existing east-west collector in the vicinity of the proposed Project site. Alluvial Avenue extends westerly from its intersection with Temperance Avenue through the City of Clovis and into the City of Fresno. East of Temperance Avenue, Alluvial Avenue turns into Owens Mountain Parkway. Alluvial Avenue is a four-lane divided collector west of Temperance Avenue and a two-lane undivided roadway east of Temperance Avenue. Based on information provided by the City of Clovis engineering staff, the easterly extension of Alluvial Avenue (Owens Mountain Parkway) will terminate at the interchange of Nees Avenue and SR 168.

**New Temperance Access Road** is a previously approved right-in right-out local access road to Temperance Avenue.

**Fir Avenue** is an existing divided local roadway adjacent to the proposed Project site. Fir Avenue connects Temperance Avenue and Medical Center Drive West and serves as the main access to the Clovis Community Medical Center from SR 168. The 2035 Clovis General Plan Circulation Element designates Fir Avenue as a local street within the City of Clovis.

**Herndon Avenue** is an existing arterial in the vicinity of the proposed Project site. Herndon Avenue is an east-west major street that extends through the City of Clovis, City of Fresno and beyond for just over twenty miles. It is also the most northerly continuous route on the Fresno County side of the San Joaquin River. Near the Project site, Herndon Avenue is a four-lane divided arterial west of Temperance Avenue and a two-lane undivided arterial east of Temperance Avenue. The 2035 Clovis General Plan Circulation Element designates Herndon Avenue as a six-lane divided expressway between Willow Avenue and SR 168, a six-lane divided arterial between SR 168 and Coventry Avenue, and a four-lane divided arterial east of Coventry Avenue within the City of Clovis.

**Bullard Avenue** is an existing east-west two- to four-lane divided roadway in the vicinity of the proposed Project site. In this area, Bullard Avenue is a four-lane undivided arterial between Locan Avenue and De Wolf Avenue. The 2035 Clovis General Plan Circulation Element designates Bullard Avenue as a four-lane divided arterial between Willow Avenue and Harvard Avenue and between Purdue Avenue and McCall Avenue in the City of Clovis.

**Armstrong Avenue** is an existing north-south undivided roadway in the vicinity of the proposed Project site. Armstrong Avenue is a two- to four-lane undivided collector from the southern Clovis city limits just south of Ashlan Avenue to its northern terminus at Nees Avenue. The 2035 Clovis General Plan Circulation Element designates Armstrong Avenue between Nees Avenue and the southern City limits as an undivided collector within the City of Clovis.

**Tollhouse Road** is an existing two-lane collector in the vicinity of the proposed Project site and traverses the City of Clovis in a northeast-southwest direction. Tollhouse Road exists from Sunnyside Avenue to its intersection with the old Temperance Avenue south of SR 168 and between Medical Center Drive East and Thompson Avenue. The 2035 Clovis General Plan Circulation Element designates Tollhouse Road as a collector between Sunnyside Avenue and Herndon Avenue and a rural collector between Clovis Community Medical Center Drive and Cole Avenue within the City of Clovis.

**Temperance Avenue** is an existing north-south four-lane divided limited access expressway in the vicinity of the proposed Project site. It connects to Shepherd Avenue on the north and continues over 16 miles to Golden State Boulevard on the south. The 2035 Clovis General Plan Circulation Element designates Temperance Avenue as an arterial north of SR 168 and an expressway south of SR 168 within the City of Clovis.

**Medical Center Drive** is an existing two-lane undivided collector adjacent to the proposed Project site. Medical Center Drive runs on all sides of the Clovis Community Medical Center, encircling the Medical Center. The 2035 Clovis General Plan Circulation Element designates Medical Center Drive as a private local street within the City of Clovis.

**Coventry Avenue** is an existing street adjacent to the proposed Project site. North of Herndon Avenue, Coventry Avenue is a four-lane divided collector connecting Herndon Avenue and Medical Center Drive South and serves as the main access to the Clovis Community Medical Center from Herndon Avenue. South of Herndon Avenue, Coventry Avenue is a two-lane undivided local street.

**CCMC Access Road** is an existing two-lane undivided local roadway in the vicinity of the proposed Project site. CCMC Access Road runs north-south in its connection to Herndon Avenue and east-west in its connection to Medical Center Drive.

**Locan Avenue** is an existing north-south two-lane undivided collector in the vicinity of the proposed Project site. In this area, Locan Avenue extends south of Herndon Avenue. The 2035 Clovis General Plan Circulation Element designates Locan Avenue as an undivided collector between Shepherd Avenue and Nees Avenue and south of Herndon Avenue within the City of Clovis.

**De Wolf Avenue** is an existing north-south two-lane collector in the vicinity of the proposed Project site. In this area, De Wolf Avenue connects Tollhouse Road and Herndon Avenue and continues south of Herndon Avenue approximately five miles to Olive Avenue in the City of Fresno. The 2035 Clovis General Plan Circulation Element designates De Wolf Avenue as an arterial between Shepherd Avenue and Owens Mountain Parkway and a collector between Tollhouse Road and the southern Clovis city limits.

**Leonard Avenue** is an existing north-south two-lane local roadway in the vicinity of the proposed Project site. In this area, Leonard Avenue extends southerly from Herndon Avenue approximately one half mile. The Clovis 2035 General Plan Circulation Element designates Leonard Avenue as a local roadway between Herndon Avenue and Bullard Avenue and a divided arterial between Bullard Avenue and Ashlan Avenue.

**McCall Avenue** is an existing north-south two-lane major roadway in the vicinity of the proposed Project site. McCall Avenue extends southerly from Herndon Avenue through the City of Clovis sphere of influence and continues onto the City of Selma beyond SR 99. McCall Avenue is planned to extend northwesterly to the existing intersection of SR 168 and Shepherd Avenue north of Herndon Avenue. The Clovis 2035 General Plan Circulation Element designates McCall Avenue as an arterial within the City of Clovis. Economic and market analysis performed in 2001 for the Southeast Urban Center Specific Plan identified the critical role that the improvement of McCall Avenue will play in the development of commercial properties in the area.

**Academy Avenue** is an existing north-south two-lane major roadway in the vicinity of the proposed Project site. Academy Avenue extends southerly from SR 168 through the Cities of Sanger, Parlier, and Kingsburg at the southern edge of Fresno County. The Fresno County General Plan Circulation Element designates Academy Avenue as a rural arterial within the County of Fresno.

## Results of Existing Level of Service Analysis

Table I presents a summary of the existing peak hour LOS at the study intersections, while Table II presents a summary of the existing LOS for the study segments. Figure 2 illustrates the existing traffic volumes, intersection geometrics, and controls. LOS worksheets for the Existing Traffic Conditions scenario are provided in Appendix E. Except for the intersection of SR 168 EB Ramps at Temperance Avenue, all study intersections are projected to operate at an acceptable LOS during both the AM and PM peak hours.

To improve the LOS at this intersection, it is recommended that a second eastbound left-turn lane be added and that the existing traffic signal be modified to accommodate the added lane geometrics.

Under this scenario, all study segments operate at an acceptable LOS.

**Table I: Existing Intersection LOS Results**

|    | Intersection                           | Intersection Control   | (7-9) AM Peak Hour         |          | (4-6) PM Peak Hour         |     |
|----|--|------------------------|----------------------------|----------|----------------------------|-----|
|    |  |                        | Average Delay<br>(sec/veh) | LOS      | Average Delay<br>(sec/veh) | LOS |
| 1  | Nees Avenue / Temperance Avenue        | Signalized             | 18.0                       | B        | 31.2                       | C   |
| 2  | Alluvial Avenue / Temperance Avenue    | Signalized             | 44.6                       | D        | 16.0                       | B   |
| 3  | SR 168 WB Ramps / Temperance Avenue    | Signalized             | 4.9                        | A        | 2.9                        | A   |
| 4  | SR 168 EB Ramps / Temperance Avenue    | Signalized             | <b>37.6</b>                | <b>D</b> | 32.3                       | C   |
|    |  | Signalized (Mitigated) | 27.7                       | C        | 14.2                       | B   |
| 5  | Fir Avenue / Temperance Avenue         | Signalized             | 14.7                       | B        | 9.7                        | A   |
| 6  | Fir Avenue / Medical Center Drive      | Roundabout             | 6.1                        | A        | 5.6                        | A   |
| 7  | Herndon Avenue / Armstrong Avenue      | Signalized             | 17.8                       | B        | 15.2                       | B   |

| 12 | Herndon Avenue / CCMC Access Road      | One-Way STOP           | 16.5                       | C        | 16.2                       | C   |
| 13 | Herndon Avenue / Locan Avenue          | One-Way STOP           | 26.7                       | D        | 19.5                       | C   |
| 14 | Herndon Avenue / De Wolf Avenue (NL)   | One-Way STOP           | 17.2                       | C        | 14.5                       | B   |
| 15 | Herndon Avenue / De Wolf Avenue (SL)   | One-Way STOP           | 24.1                       | C        | 21.2                       | C   |
| 16 | Herndon Avenue / Leonard Avenue        | One-Way STOP           | 14.1                       | B        | 14.0                       | B   |
| 17 | Herndon Avenue / McCall Avenue         | One-Way STOP           | 15.0                       | C        | 14.3                       | B   |
| 18 | Herndon Avenue / Academy Avenue        | Two-Way STOP           | 13.3                       | B        | 14.3                       | B   |
| 19 | New Access Road / Temperance Avenue    | Does Not Exist         | N/A                        | N/A      | N/A                        | N/A |
| 20 | Bullard Avenue / Locan Avenue          | All-Way STOP           | 12.9                       | B        | 10.5                       | B   |
| 21 | Bullard Avenue / De Wolf Avenue        | All-Way STOP           | 14.3                       | B        | 11.0                       | B   |

Notes: LOS = Level of Service based on average delay on signalized intersections and All-Way STOP Controls  
LOS for Two-Way and One-Way STOP controlled intersections are based on the worst approach/movement of the minor street.

**Table II: Existing Segment LOS Results**

| <i>Study Segment</i> | <i>Limits</i>                               | <i>Lanes</i> | <i>24-hour Volume</i> | <i>LOS</i> |
|----------------------|---|--------------|-----------------------|------------|
| Herndon Avenue       | Armstrong Avenue and Tollhouse Road         | 5            | 14,684                | C          |
| Herndon Avenue       | Tollhouse Road and Temperance Avenue        | 5            | 15,142                | C          |
| Herndon Avenue       | Temperance Avenue and Coventry Avenue       | 5            | 14,937                | C          |

| Locan Avenue         | Herndon Avenue and Bullard Avenue           | 2            | 1,886                 | B          |

Notes: LOS = Level of Service per the Florida Roadway Segment LOS Tables

### *Traffic Signal Warrants*

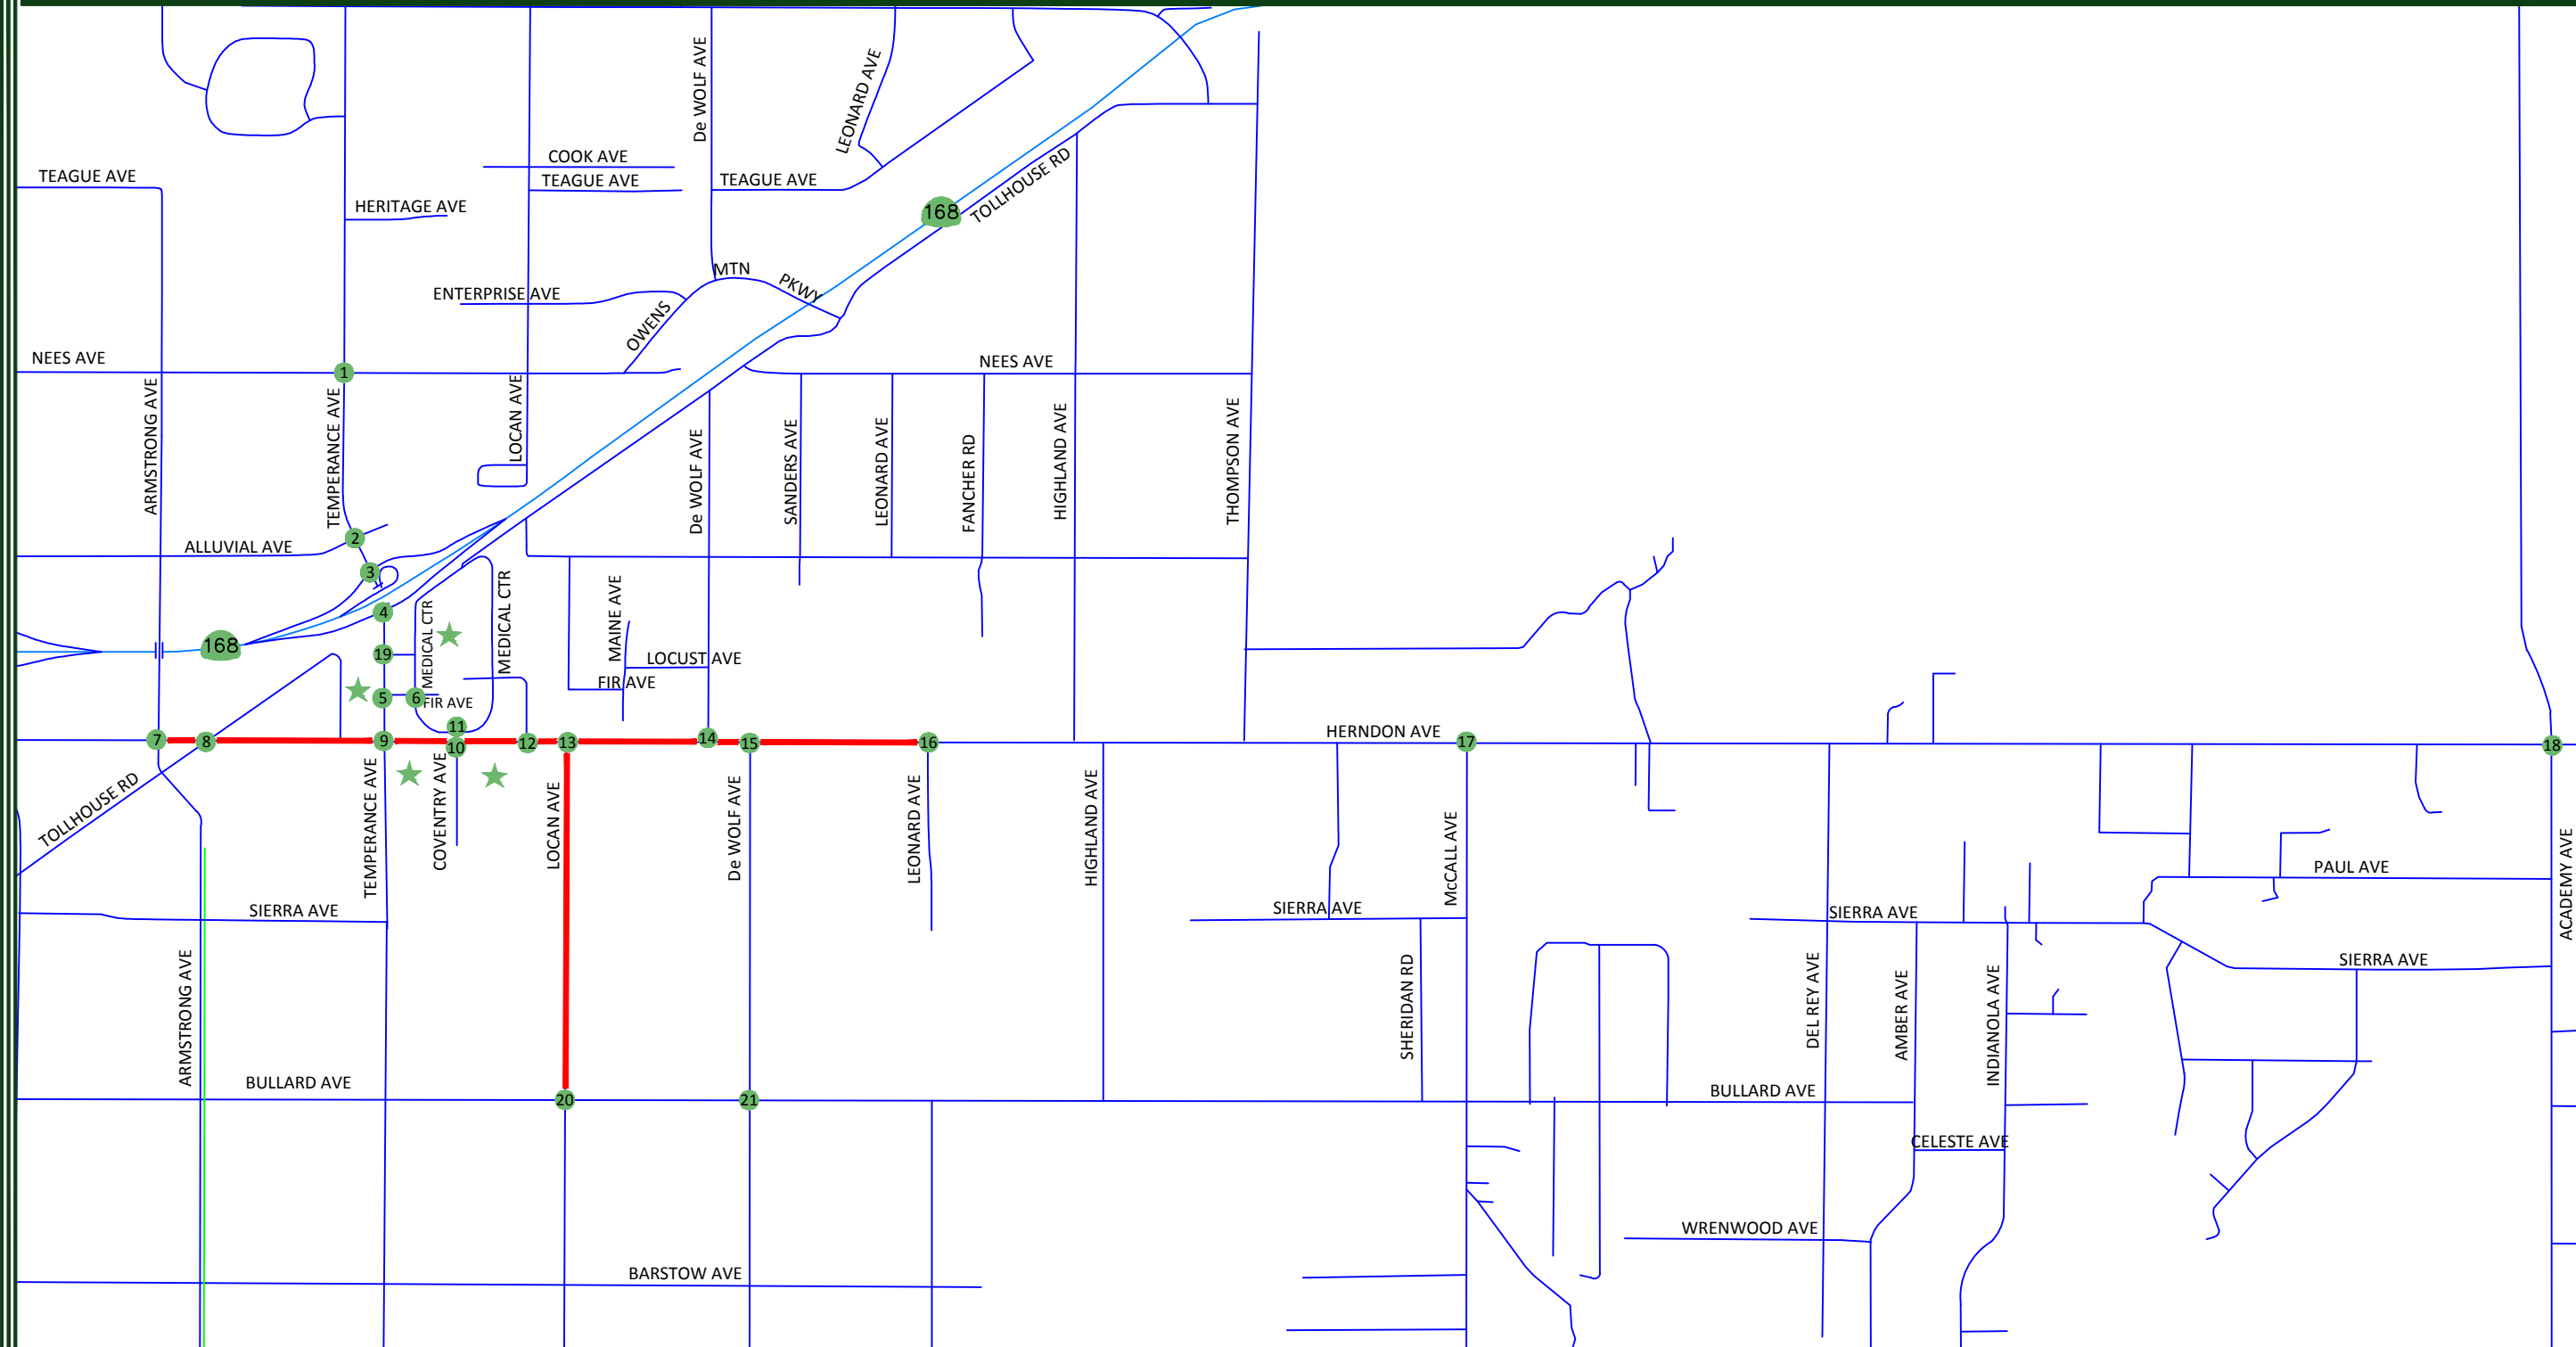

Peak hour traffic signal warrants were prepared for the unsignalized study intersections for the Existing scenario. These warrants are found in Appendix J. Under this scenario, the intersections of Herndon Avenue at Locan Avenue and Herndon Avenue at De Wolf Avenue (south leg) satisfy peak hour signal warrants during both peaks, while the intersection of Bullard Avenue at De Wolf Avenue satisfies peak hour signal warrants during the AM peak only. Based on the signal warrants, the intersection operational analysis and traffic engineering judgment, signalization of these intersections is not recommended. It is worth noting that CA MUTCD states “satisfaction of a signal warrant or warrants shall not in itself require the installation of a traffic signal.” Therefore, it is recommended that prior to the installation of a traffic signal, investigation of CA MUTCD warrants 1, 4, and 7, as applicable, be conducted for these intersections.

## Existing plus Project Phase 1 Traffic Conditions

### Project Description

The Project evaluated in this TIA includes two components. The first component is the proposed Clovis Community Medical Center (CCMC) Expansion Project, which is a phased project over the next 20 years. The CCMC expansion plan includes construction of new inpatient bed towers, medical office buildings, a general support building, a cancer center, a central plant, and a parking garage along with the expansion of the emergency department, surgical facilities, materials management and the outpatient community center. In addition, the CCMC project includes the potential development of areas adjacent to the main campus, primarily with retail commercial buildings, as well as a hotel and an assisted living center. The Clovis Community Medical Center Expansion Project will be completed in two phases.

The second component, the Herndon Avenue Project, is the proposed widening of Herndon Avenue from Temperance Avenue to De Wolf Avenue (south leg). Herndon Avenue will be widened to six lanes between Temperance Avenue and Coventry Avenue and four lanes from Coventry Avenue to the south leg of De Wolf Avenue. As needed, existing traffic signals within the Herndon Widening Project will be modified to accommodate the proposed lane geometrics. The Herndon Avenue Widening Project is anticipated to be completed by the City of Clovis in 2019 and thus from the Existing plus Project scenario forward, the widening of Herndon Avenue between Temperance Avenue and the south leg of De Wolf Avenue is part of the baseline lane geometrics.

Clovis Community Medical Center is planning a major expansion to its Healthcare Campus at Herndon Avenue and Temperance Avenue. The need for the expansion is due to the accelerating bed demand in Clovis resulting from the high population growth rate in the area. The expansion is divided into two major phases: (a) Phase 1: includes the anticipated Ten-Year Expansion Plan for the additional facilities and improvements that will be constructed by 2026, and (b) Phase 2: the Long-Range Development Site Plan that will be constructed by 2035. Figure 3 illustrates the Ten-Year Expansion Plan (Year 2026) along with the Long-Range Development Site Plan (Year 2035).

The Phase 1 Expansion Plan (Year 2026) consists of adding a 300,172 square-foot expansion of the existing hospital, 94,392 square feet of Medical Dental Office Building, 150,000 square feet of Shopping Center, and a 150 room Hotel.

The Phase 2 Long-Range Master Plan (Year 2035) expansion includes another 168,672 square-foot expansion of the existing hospital, 260,000 square feet of Medical Dental Office Building, 70,000 square feet of Shopping Center, and a 100 bed Assisted Living Facility.

## Transit

Clovis Transit is the transit operator in the City of Clovis. Currently, the nearest transit stop to the Project site is the Clovis Stageline Transit Route 50. Route 50 runs in the vicinity of the proposed Project via Temperance Avenue. This route provides a direct connection to Cal Skate, Kaiser Medical Center, Sierra Vista Mall, Clovis High School, CART (Center for Applied Research and Technology), Mickey Cox Elementary School, Clovis Community Medical Center, Clovis Civic Center, and Clark Junior High School. Route 50 operates at one-hour intervals Monday through Saturday. Its stop nearest to the project site is located on Temperance Avenue north of the intersection at Temperance Avenue and Fir Avenue.

## Bikeways

Currently, bike lanes exist in the vicinity of the project on its frontages to Herndon Avenue and Temperance Avenue. The 2035 Clovis General Plan Circulation Element designates Herndon Avenue and Temperance Avenue as Class II bike lanes.

## Travel Demand Analysis

### *Travel Demand Modeling Approach*

The Council of Fresno County Governments (Fresno COG) countywide gravity based model was used in the study. The current Fresno COG model is an AM and PM peak model. The model estimates peak hour trips using a trip generation equation for each land use type. After trip generation, the model distributes all the trips between their origins and destinations onto the roadway network in the model and assigns trips to individual streets.

JLB submitted a traffic modeling request to Fresno COG staff to update the major street network and add the existing and proposed Project land uses. The detailed network and corresponding land use data were provided by JLB to Fresno COG staff. Fresno COG completed all model runs. The electronic files of the model runs were then provided to JLB for post processing. The Furness Method, which modifies model-estimated turning volumes based upon observed turning volume counts, was utilized. Additionally, as recommended by the Model Steering Committee, the increment method was utilized to determine traffic volumes for the both Cumulative Year 2035 scenarios. Traffic models are contained in Appendix D.

### *Trip Generation*

Trip generation for the proposed Project is based on information provided by the Clovis Community Medical Center and the City of Clovis and trip rates are obtained from the standard reference Trip Generation, 9th Edition, published by the Institute of Transportation Engineers (ITE). Table III summarizes the trip generation for the proposed Phase 1 Expansion Plan (Year 2026), while Table IV summarizes the additional trip generation of the Phase 2 Long-Range Master Plan (Year 2035). Phase 1 of the CCMC is estimated to generate a maximum of 15,121 daily trips, 756 AM peak hour trips and 1,278 PM peak hour trips while Phase 2 of the CCMC is estimated to generate a maximum of 14,887 daily trips, 866 AM peak hour trips and 1,374 PM peak hour trips. Table V summarizes the cumulative trip generation of the CCMC Phase 1 (Year 2026) and Phase 2 Long-Range (Year 2035) Plans at build-out. At build-out, the CCMC Project is estimated to generate a maximum of 30,008 daily trips, 1,622 AM peak hour trips and 2,652 PM peak hour trips.

### Trip Distribution

Project trips were assigned to the study intersections based on existing travel patterns, the Fresno COG traffic model runs, communication with City of Clovis staff, knowledge of the study area, traffic engineering judgement, and the Clovis General Plan Circulation Element. Figure 4 illustrates the Phase 1 Project Only trip assignment to the study intersections and segments under the Existing plus Project Phase 1 scenario.

### Results of Existing plus Project Phase 1 Level of Service Analysis

The Existing plus Project Phase 1 scenario represents the anticipated operations of the study intersections and segments under the assumption of an immediate build-out of the Phase 1 Plan. It is unlikely that these conditions will occur since build-out of the Phase 1 Plans expected to occur over the next ten years.

Therefore, the analyses presented herein should be considered a worst-case scenario.

The Existing plus Project Phase 1 turning movement volumes, intersection geometrics, and controls are illustrated in Figure 5. By this scenario, it is assumed that the Herndon Avenue Project, the expansion of Herndon Avenue between Temperance Avenue and the south leg of De Wolf Avenue, has been

**Traffic Engineering, Inc.**

Page | 17

completed. Therefore, this scenario takes into account the added lane geometric as illustrated in Figure 5 for this section of Herndon Avenue and the intersections of Herndon Avenue at Coventry Avenue, Herndon Avenue at CCMC Access Road, Herndon Avenue at Locan Avenue, Herndon Avenue at De Wolf Avenue (north leg), and Herndon Avenue at De Wolf Avenue (south leg). For all other study intersections and segments, this scenario assumes that the existing roadway geometrics and traffic controls will remain in place. The study intersection LOS calculation results are contained in Appendix F. Tables VI and VII summarize the LOS at the study intersections and segments, respectively, under the Existing plus Project Phase 1 scenario. Similar to the previous scenario, except for the intersection of SR 168 EB Ramps at Temperance Avenue, all study intersections are projected to operate at an acceptable LOS during both the AM and PM peak hours.

To improve the LOS at this intersection, it is recommended that a second eastbound right-turn lane and third northbound through lane be added and that the existing traffic signal be modified to accommodate the added lane geometrics.

Under this scenario, all study segments are projected to operate at an acceptable LOS.

**Table VI: Existing plus Project Phase 1 Intersection LOS Results**

Notes: LOS = Level of Service per the Florida Roadway Segment LOS Tables

### *Traffic Signal Warrants*

Peak hour traffic signal warrants were prepared for the unsignalized study intersections for the Existing plus Project Phase 1 Traffic Conditions scenario. These warrants are found in Appendix J. Under this scenario, the intersection of Herndon Avenue at Locan Avenue satisfies peak hour signal warrants during both peaks, while the intersection of Bullard Avenue at De Wolf Avenue and Herndon Avenue at De Wolf Avenue satisfy peak hour signal warrants during the AM peak only and the intersection of Herndon Avenue at Tollhouse Road satisfies peak hour signal warrants during the PM peak only. Based on the signal warrants, the intersection operational analysis and traffic engineering judgment, signalization of these intersections is not recommended. It is worth noting that CA MUTCD states “satisfaction of a signal warrant or warrants shall not in itself require the installation of a traffic signal.” Therefore, it is recommended that prior to the installation of a traffic signal, investigation of CA MUTCD warrants 1, 4, and 7, as applicable, be conducted for these intersections.

## Near Term plus Project Phase 1 Traffic Conditions

### Description of Approved and Pipeline Projects

Approved and Pipeline Projects consist of developments that are either under construction, built but not fully occupied, are not built but have final site development review (SDR) approval, or for which the lead agency or responsible agencies have knowledge of. On September 13, 2016, JLB staff conducted a reconnaissance of the surrounding area to confirm the near term projects. Subsequently, it was agreed that the projects listed in Table VIII were approved, near approval, or in the pipeline within the proximity of the Project site.

The trip generation listed in Table VIII is that which is anticipated to be added to the streets and highways by these projects between the time of the preparation of this report and five years after build-out of Phase 1. Near term projects are estimated to generate 45,938 daily trips, 4,655 AM peak hour trips and 5,267 PM peak hour trips. Figure 6 illustrates the location of the approved, near approval, or pipeline projects and their combined trip assignment to the study intersections and segments under this scenario.

**Table VIII: Near Term plus Project Phase 1 Trip Generation**

## Results of Near Term plus Project Phase 1 Level of Service Analysis

This scenario assumes that the baseline lane geometrics and traffic controls for the Existing plus Project Phase 1 Traffic Conditions scenario will remain in place with one exception. The exception is that the intersection of Alluvial Avenue at Temperance Avenue will transition from a signalized intersection to a two-lane roundabout. At present, the City of Clovis is finalizing the construction documents for the roundabout and construction is projected to be completed by the year 2020. Therefore, this scenario analyzes the intersection of Alluvial Avenue at Temperance Avenue as a two-lane roundabout.

The Near Term Project Only trips are illustrated in Figure 6, while the Near Term plus Project Phase 1 total turning movement volumes, intersection geometrics, and traffic controls are illustrated in Figure 7. The study intersection's LOS calculation results are contained in Appendix G. Tables IX and X summarize the LOS at the study intersections and segments, respectively, under this scenario. Under this scenario, except for the intersections of SR 168 EB Ramps at Temperance Avenue, Herndon Avenue at Temperance Avenue, and Herndon Avenue at De Wolf Avenue (south leg), all intersections are projected to operate at acceptable LOS during both the AM and PM peak hours.

To improve the LOS at each one of the intersections projected to exceed its LOS threshold, it is recommended that the improvement measures recommended under the Existing plus Project Phase 1 Traffic Conditions scenario be implemented along with the following.

- Herndon Avenue at Temperance Avenue
  - Implement overlap phasing of the westbound right-turn with the southbound left-turn phase
  - Prohibit southbound to northbound U-turns
- Herndon Avenue at De Wolf Avenue (south leg)
  - Add All-Way STOP traffic controls

It should be noted that of the near term projects, the Project being analyzed accounts for 24.8, 14.0 and 19.5 percent of the total near term project traffic for the daily, AM and PM peak hours, respectively. Therefore, it can be deduced that the mitigation measures presented under this scenario may not be necessary immediately upon completion of the proposed Phase 1 Project. However, assuming that all of the near term projects are developed close to the completion date of the Phase 1 Project being analyzed, the detailed mitigation measures presented in the Near Term plus Project Phase 1 scenario will be necessary in order to improve the LOS to an acceptable threshold.

Under this scenario, all study segments are projected to operate at an acceptable LOS.

### *Traffic Signal Warrants*

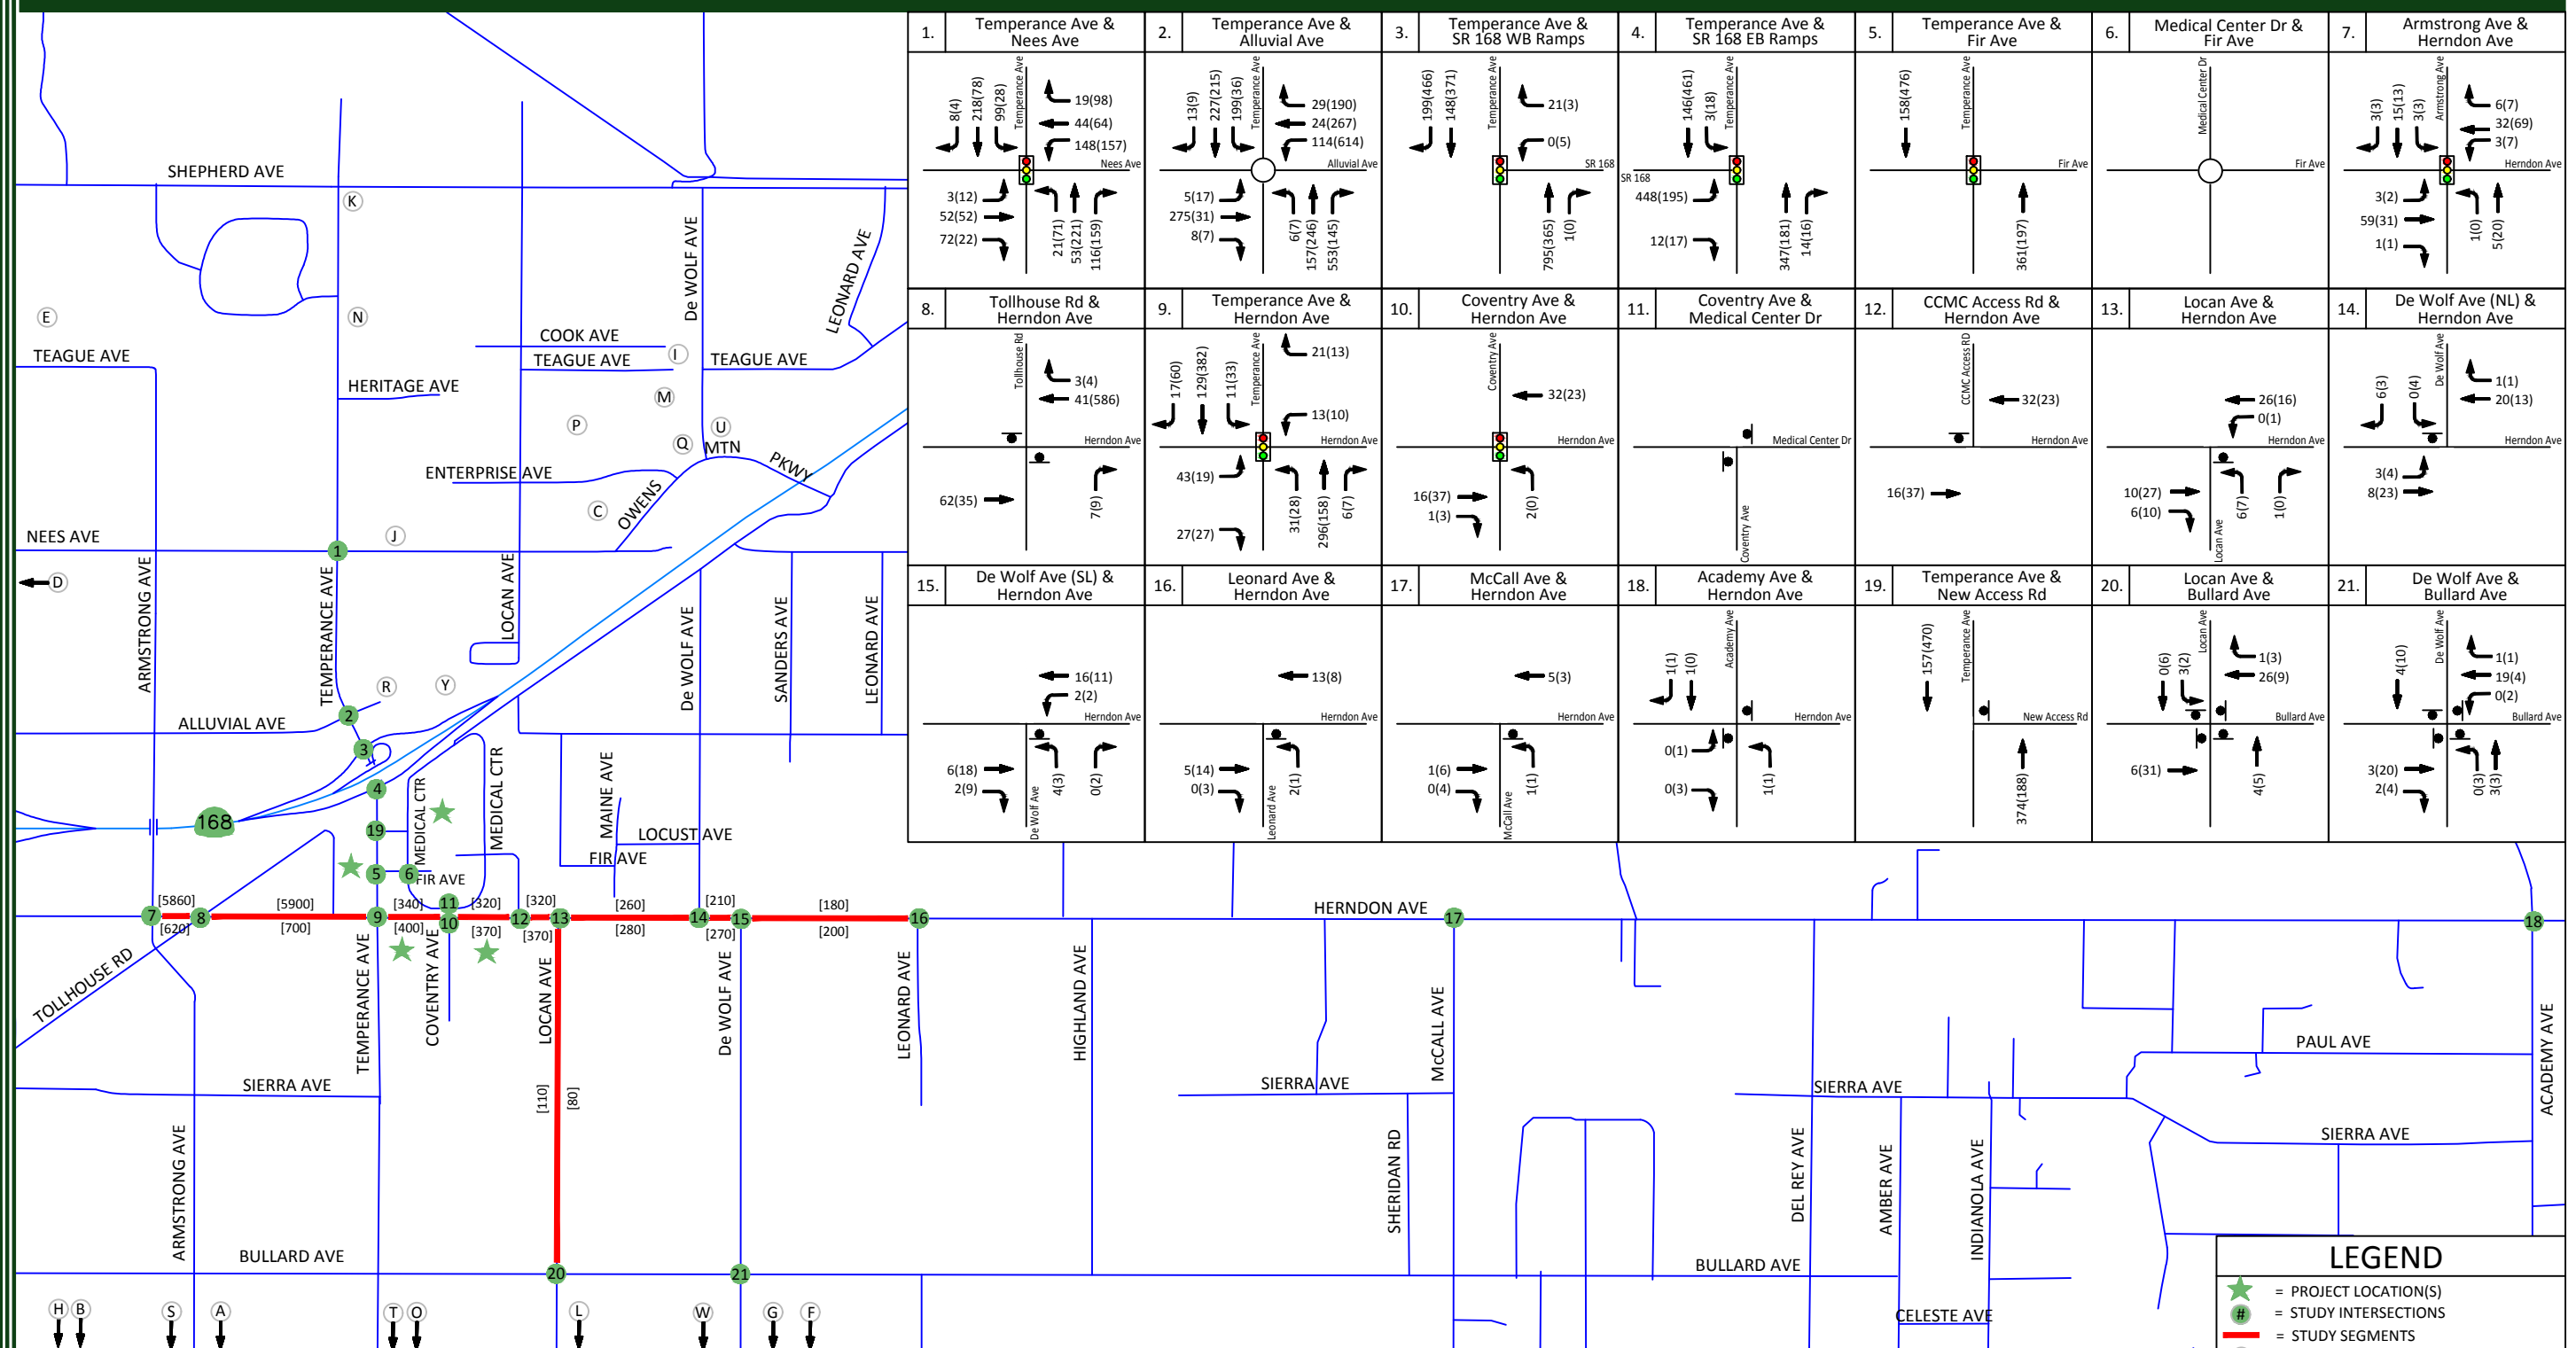

Peak hour traffic signal warrants were prepared for the unsignalized study intersections for the Near Term plus Project Phase 1 Traffic Conditions scenario. These warrants are found in Appendix J. Under this scenario, the intersection of Herndon Avenue at Locan Avenue satisfies peak hour signal warrants during both peaks, while the intersections of Herndon Avenue at De Wolf Avenue (south leg), Herndon Avenue at McCall Avenue and Bullard Avenue at De Wolf Avenue satisfy peak hour signal warrants during the AM peak only and Herndon Avenue at Tollhouse Road satisfies peak hour signal warrants during the PM peak only. Based on the signal warrants, the intersection operational analysis and traffic engineering judgment, signalization of these intersections is not recommended. It is worth noting that CA MUTCD states “satisfaction of a signal warrant or warrants shall not in itself require the installation of a traffic signal.” Therefore, it is recommended that prior to the installation of a traffic signal, investigation of CA MUTCD warrants 1, 4, and 7, as applicable, be conducted for these intersections.

## Cumulative Year 2035 No Project Traffic Conditions

Per information obtained from the City of Clovis and the Fresno COG model, it is projected that McCall Avenue will be constructed between Herndon Avenue and SR 168 by the year 2035. As a result, this scenario assumes the presence of McCall Avenue north of Herndon Avenue. This scenario assumes that the lane geometrics and traffic controls presented for the Near Term plus Project Phase 1 Traffic Conditions scenario will remain in place.

## Results of Cumulative Year 2035 No Project Level of Service Analysis

The study intersection LOS calculation results are contained in Appendix H. Tables XI and XII summarize the LOS at the study intersections and segments, respectively, under all study scenarios. The Cumulative Year 2035 No Project total turning movement volumes, intersection geometrics, and traffic controls are illustrated in Figure 8.

Under this scenario, several of the study intersections are expected to exceed their respective LOS thresholds. These include the intersections of SR 168 EB Ramps at Temperance Avenue, Herndon Avenue at Armstrong Avenue, Herndon Avenue at Temperance Avenue, Herndon Avenue at Locan Avenue, Herndon Avenue at De Wolf Avenue (north leg), Herndon Avenue at De Wolf Avenue (south leg), Herndon Avenue at Leonard Avenue, Herndon Avenue at McCall Avenue, Herndon Avenue at Academy Avenue, Bullard Avenue at Locan Avenue, and Bullard Avenue at De Wolf Avenue. To improve the LOS at each one of the intersections projected to exceed its LOS threshold, it is recommended that the following improvement measures as presented below and illustrated in Figure 9 be implemented.

- SR 168 EB Ramps at Temperance Avenue
  - Add a second eastbound left-turn lane
  - Add a second eastbound right-turn lane
  - Add a third northbound thru lane
  - Modify the traffic signal to accommodate the added lane geometrics
- Herndon Avenue at Armstrong Avenue
  - Add a third westbound thru lane
  - Modify the traffic signal to accommodate the added lane
- Herndon Avenue at Temperance Avenue
  - Implement overlap phasing of the westbound right-turn with the southbound left-turn phase
  - Prohibit southbound to northbound U-turns
- Herndon Avenue at Locan Avenue
  - Signalize the intersection
  - Limit pedestrian crosswalks across Herndon Avenue to the east leg of Herndon Avenue
- Herndon Avenue at De Wolf Avenue (NL)
  - Signalize the intersection
  - Limit pedestrian crosswalks across Herndon Avenue to the west leg of Herndon Avenue

- Herndon Avenue at De Wolf Avenue (SL)
  - Convert the westbound left-thru lane to a thru lane
  - Add a westbound left-turn lane
  - Signalize the intersection
  - Limit pedestrian crosswalks across Herndon Avenue to the east leg of Herndon Avenue
- Herndon Avenue at Leonard Avenue
  - Convert the westbound left-thru lane to a thru lane
  - Add a westbound left-turn lane
  - Signalize the intersection
  - Limit pedestrian crosswalks across Herndon Avenue to the east leg of Herndon Avenue
- Herndon Avenue at McCall Avenue
  - Convert the eastbound left-thru-right lane to a thru-right lane
  - Convert the westbound left-thru-right lane to a thru-right lane
  - Convert the northbound left-thru-right lane to a thru-right lane
  - Convert the southbound left-thru-right lane to a thru-right lane
  - Add left-turn lanes to all approaches
  - Signalize the intersection
- Herndon Avenue at Academy Avenue
  - Convert the eastbound left-thru-right lane to a left-thru lane
  - Add an eastbound right-turn lane
  - Convert the northbound left-thru-right lane to a thru-right lane
  - Add a northbound left-turn lane
  - Implement All-Way STOP controls
- Bullard Avenue at Locan Avenue
  - Add a second eastbound thru lane
  - Add a second westbound thru lane
  - Convert the southbound left-thru-right lane to a thru-right lane
  - Add a southbound left-turn lane
  - Signalize the intersection
- Bullard Avenue at De Wolf Avenue
  - Add an eastbound left-turn lane
  - Convert the eastbound left-thru-right lane to a thru lane
  - Add an eastbound right-turn lane
  - Convert the westbound left-thru-right lane to a thru-right lane
  - Add a westbound left-turn lane
  - Convert the northbound left-thru-right lane to a thru-right lane
  - Add a northbound left-turn lane
  - Convert the southbound left-thru-right lane to a thru-right lane
  - Add a southbound left-turn lane
  - Signalize the intersection

Under this scenario, all study segments are projected to operate at an acceptable LOS.

**Table XI: Cumulative Year 2035 No Project Intersection LOS Results**

|    | Intersection                           | Intersection Control     | (7-9) AM Peak Hour         |          | (4-6) PM Peak Hour         |          |

| Herndon Avenue       | CCMC Access Road and Locan Avenue           | 4            | 31,870                | C          |
| Herndon Avenue       | Locan Avenue and De Wolf Avenue (NL)        | 4            | 23,840                | C          |
| Herndon Avenue       | De Wolf Avenue (NL) and De Wolf Avenue (SL) | 4            | 22,870                | C          |
| Herndon Avenue       | De Wolf Avenue (SL) and Leonard Avenue      | 2            | 15,580                | C          |
| Locan Avenue         | Herndon Avenue and Bullard Avenue           | 2            | 14,970                | C          |

Notes: LOS = Level of Service per the Florida Roadway Segment LOS Tables

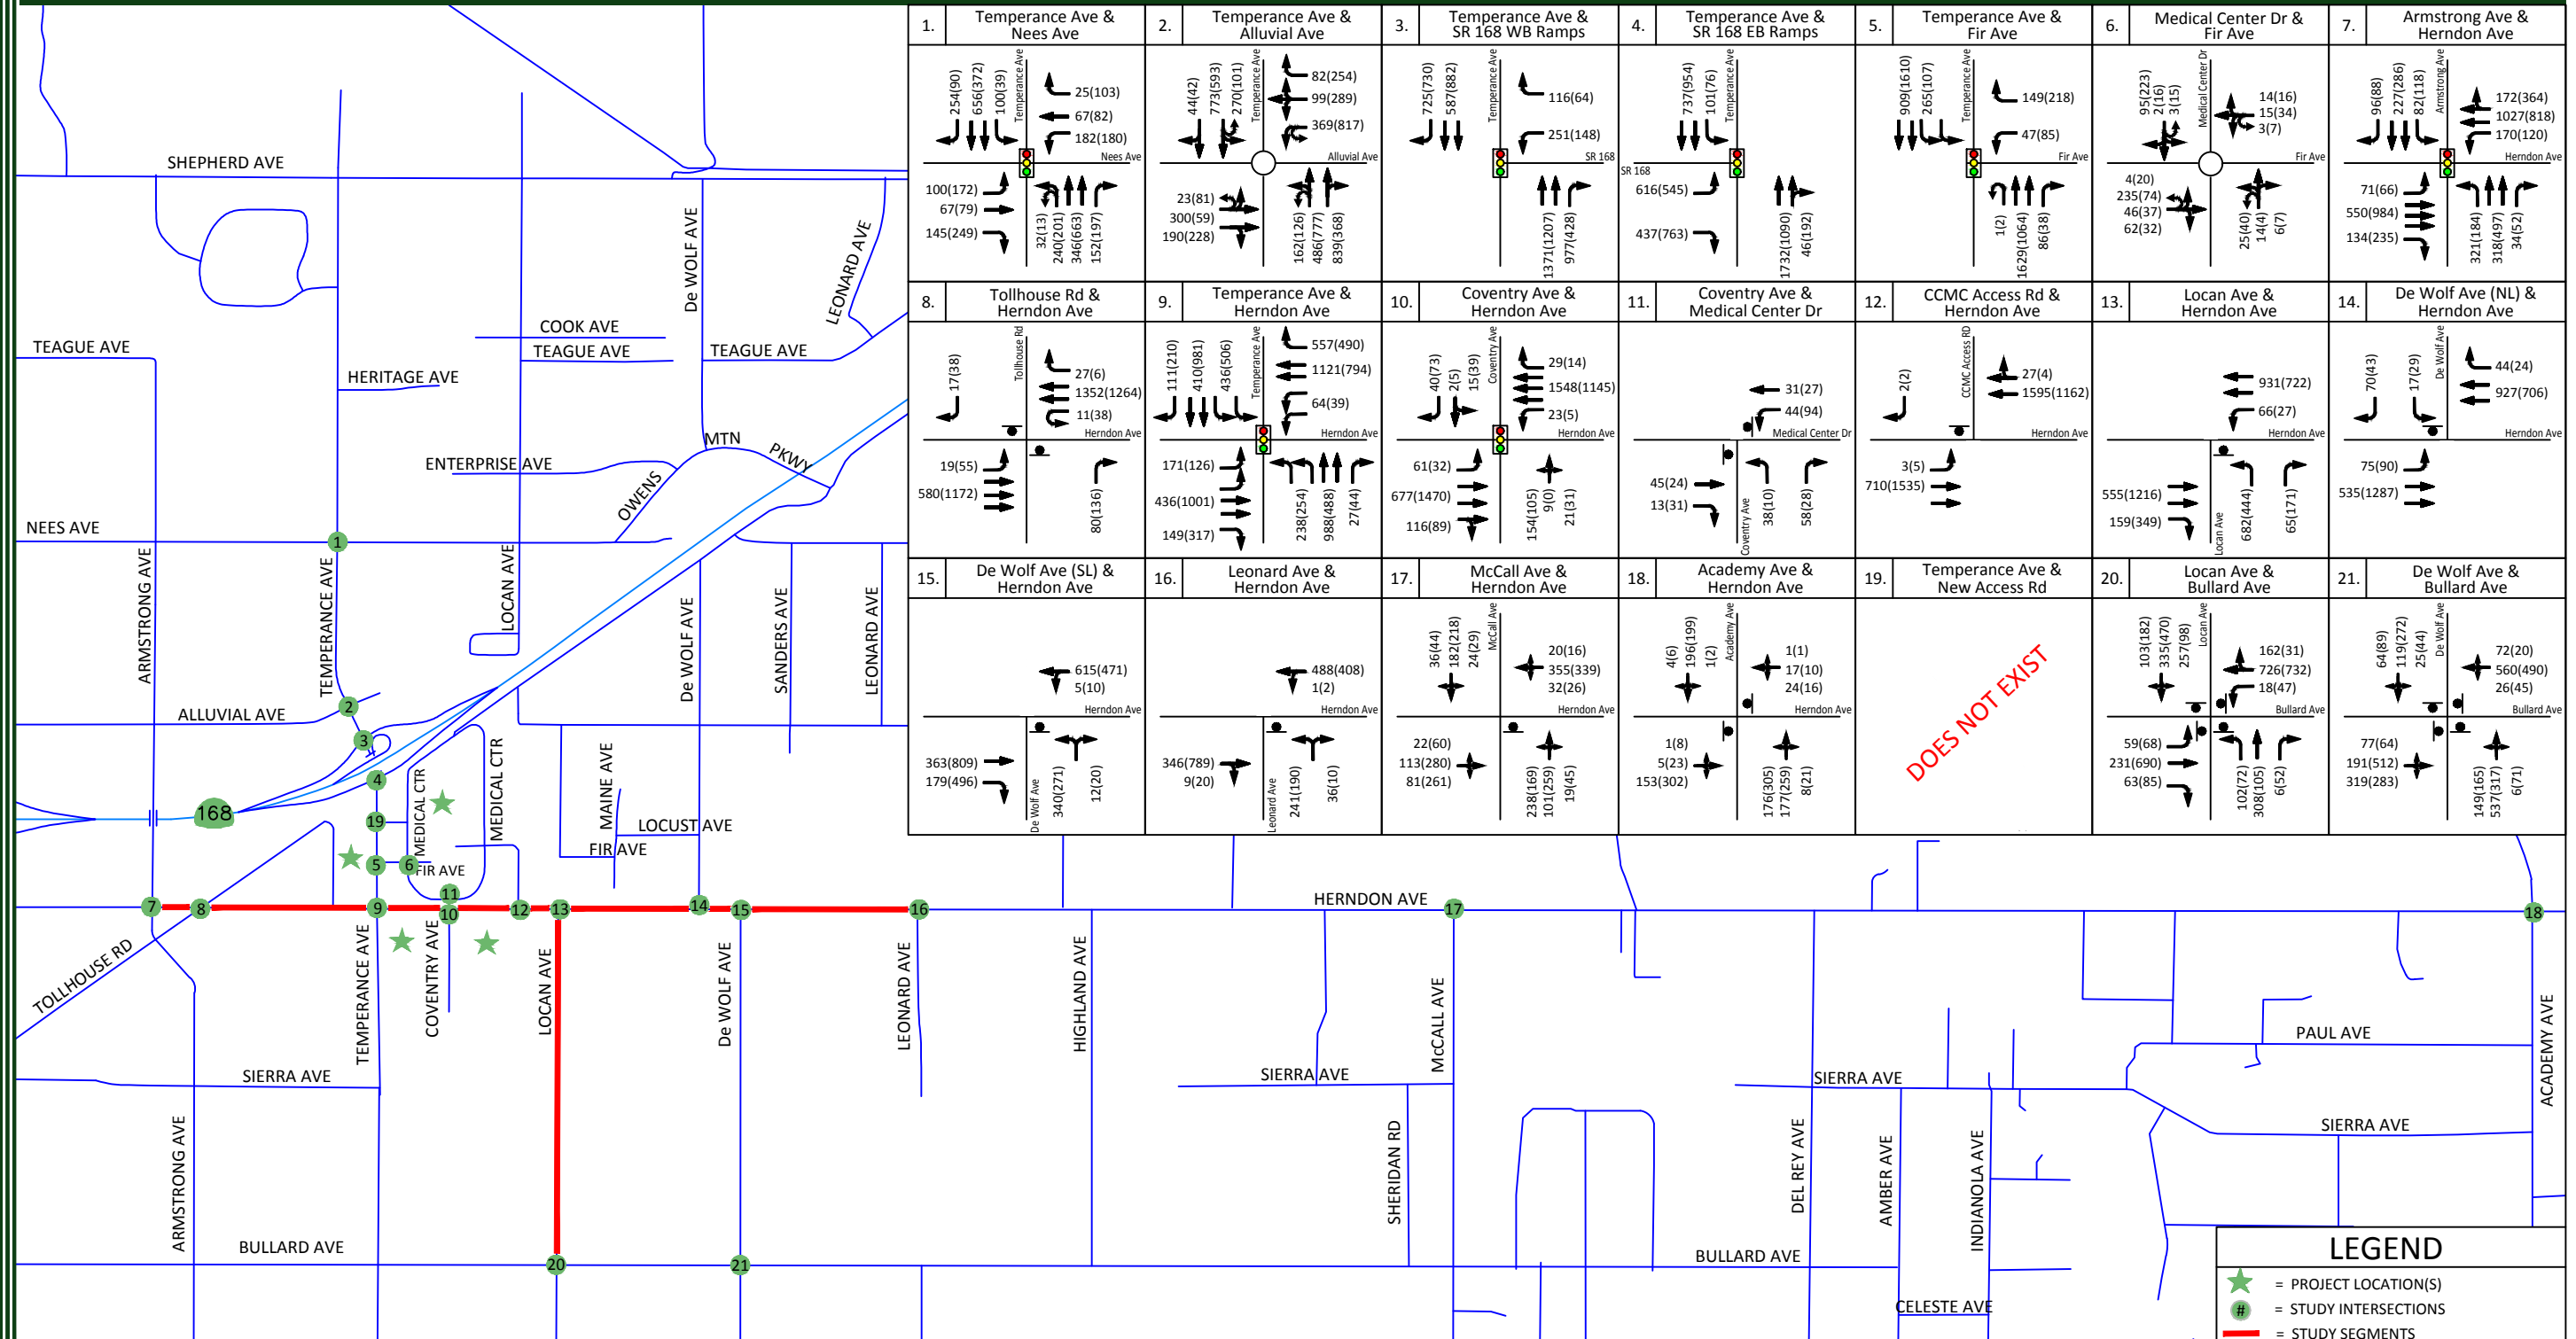

### *Traffic Signal Warrants*

Peak hour traffic signal warrants were prepared for the unsignalized study intersections for the Cumulative Year 2035 No Project Traffic Conditions scenario. These warrants are found in Appendix J. Under this scenario, the intersections of Herndon Avenue at Locan Avenue, Herndon Avenue at De Wolf Avenue (SL), Herndon Avenue at Leonard Avenue, Herndon Avenue at McCall Avenue, Bullard Avenue at Locan Avenue, and Bullard Avenue at De Wolf Avenue satisfy peak hour signal warrants during both peaks, while the intersection of Herndon Avenue at Academy Avenue satisfies peak hour signal warrants during the PM peak only. Except for the intersection of Herndon Avenue at Academy Avenue, based on the signal warrants, the intersection operational analysis and traffic engineering judgment, signalization of these intersections is recommended. The intersection of Herndon Avenue at Academy Avenue is projected to function at an acceptable LOS without the need for a traffic signal. It is worth noting that CA MUTCD states “satisfaction of a signal warrant or warrants shall not in itself require the installation of a traffic signal.” Therefore, it is recommended that prior to the installation of a traffic signal at the intersection of Herndon Avenue at Academy Avenue, investigation of CA MUTCD warrants 1, 4, and 7, as applicable, be conducted. On the other hand, the intersection of Herndon Avenue at De Wolf Avenue (north leg) is projected to operate at an unacceptable LOS threshold and implementation of All-STOP controls and the addition of lanes is not projected to improve its LOS to an acceptable level. Therefore, it is recommended that the intersection of Herndon Avenue at De Wolf Avenue (north leg) be signalized.

## Cumulative Year 2035 plus Project Traffic Conditions

Similar to the Cumulative Year 2035 No Project scenario, this scenario assumes that McCall Avenue will be constructed between Herndon Avenue and SR 168. This scenario assumes that the lane geometrics and traffic controls presented for the Near Term plus Project Phase 1 Traffic Conditions scenario will remain in place.

## Results of Cumulative Year 2035 plus Project Level of Service Analysis

The study intersection LOS calculation results are contained in Appendix I. Tables XIII and XIV summarize the LOS at the study intersections and segments, respectively, under all study scenarios. By this scenario, it is assumed that both Phase 1 and Phase 2 of the CCMC Project components would be built out. Figure 4 illustrates the Phase 1 Project Only trips while figure 10 illustrates the Phase 2 Project Only trips. The Cumulative Year 2035 plus Project total turning movement volumes, intersection geometrics, and traffic controls are illustrated in Figure 11. Under this scenario, several of the study intersections are expected to exceed their respective LOS thresholds. These include the intersections of Fir Avenue at Temperance Avenue, Herndon Avenue at Tollhouse Road, and all the intersections presented in the Cumulative Year 2035 No Project scenario. To improve the LOS at each one of the intersections projected to exceed its LOS threshold, it is recommended that the improvement measures presented below and illustrated in Figure 12 be implemented.

- For the intersections of SR 168 EB Ramps at Temperance Avenue, Herndon Avenue at Armstrong Avenue, Herndon Avenue at Temperance Avenue, Herndon Avenue at Locan Avenue, Herndon Avenue at De Wolf Avenue (NL), Herndon Avenue at De Wolf Avenue (SL), Herndon Avenue at Leonard Avenue, Herndon Avenue at McCall Avenue, Herndon Avenue at Academy Avenue, Bullard Avenue at Locan Avenue, and Bullard Avenue at De Wolf Avenue, it is recommended that the same improvements presented in the Cumulative 2035 No Project Scenario be implemented.
- Fir Avenue at Temperance Avenue
  - Add a northbound thru lane
  - Modify the traffic signal to accommodate the added lane
- Herndon Avenue at Tollhouse Road
  - The worst movement is the northbound right. JLB anticipates that as the volume of this movement increases, it will experience a higher peak hour factor in the future, which in turn will improve its LOS to D. Should a higher peak hour factor not materialize, then it is recommended that all truck traffic be prohibited from using Tollhouse Road between Armstrong Avenue and Herndon Avenue.
- New Temperance Access Road at Temperance Avenue
  - By the year 2035 it is projected that the LOS for this intersection will drop below LOS D. As this intersection is limited to right-in and right-out access, the additions of lanes is not projected to improve its LOS and implementation of a traffic signal or All-Way STOPs are not projected to be warranted. As a result, the projected LOS at this intersection would be considered adverse but not significant and therefore mitigation measures are not recommended.

Under this scenario, all study segments are projected to operate at an acceptable LOS.

Notes: LOS = Level of Service per the Florida Roadway Segment LOS Tables

### *Traffic Signal Warrants*

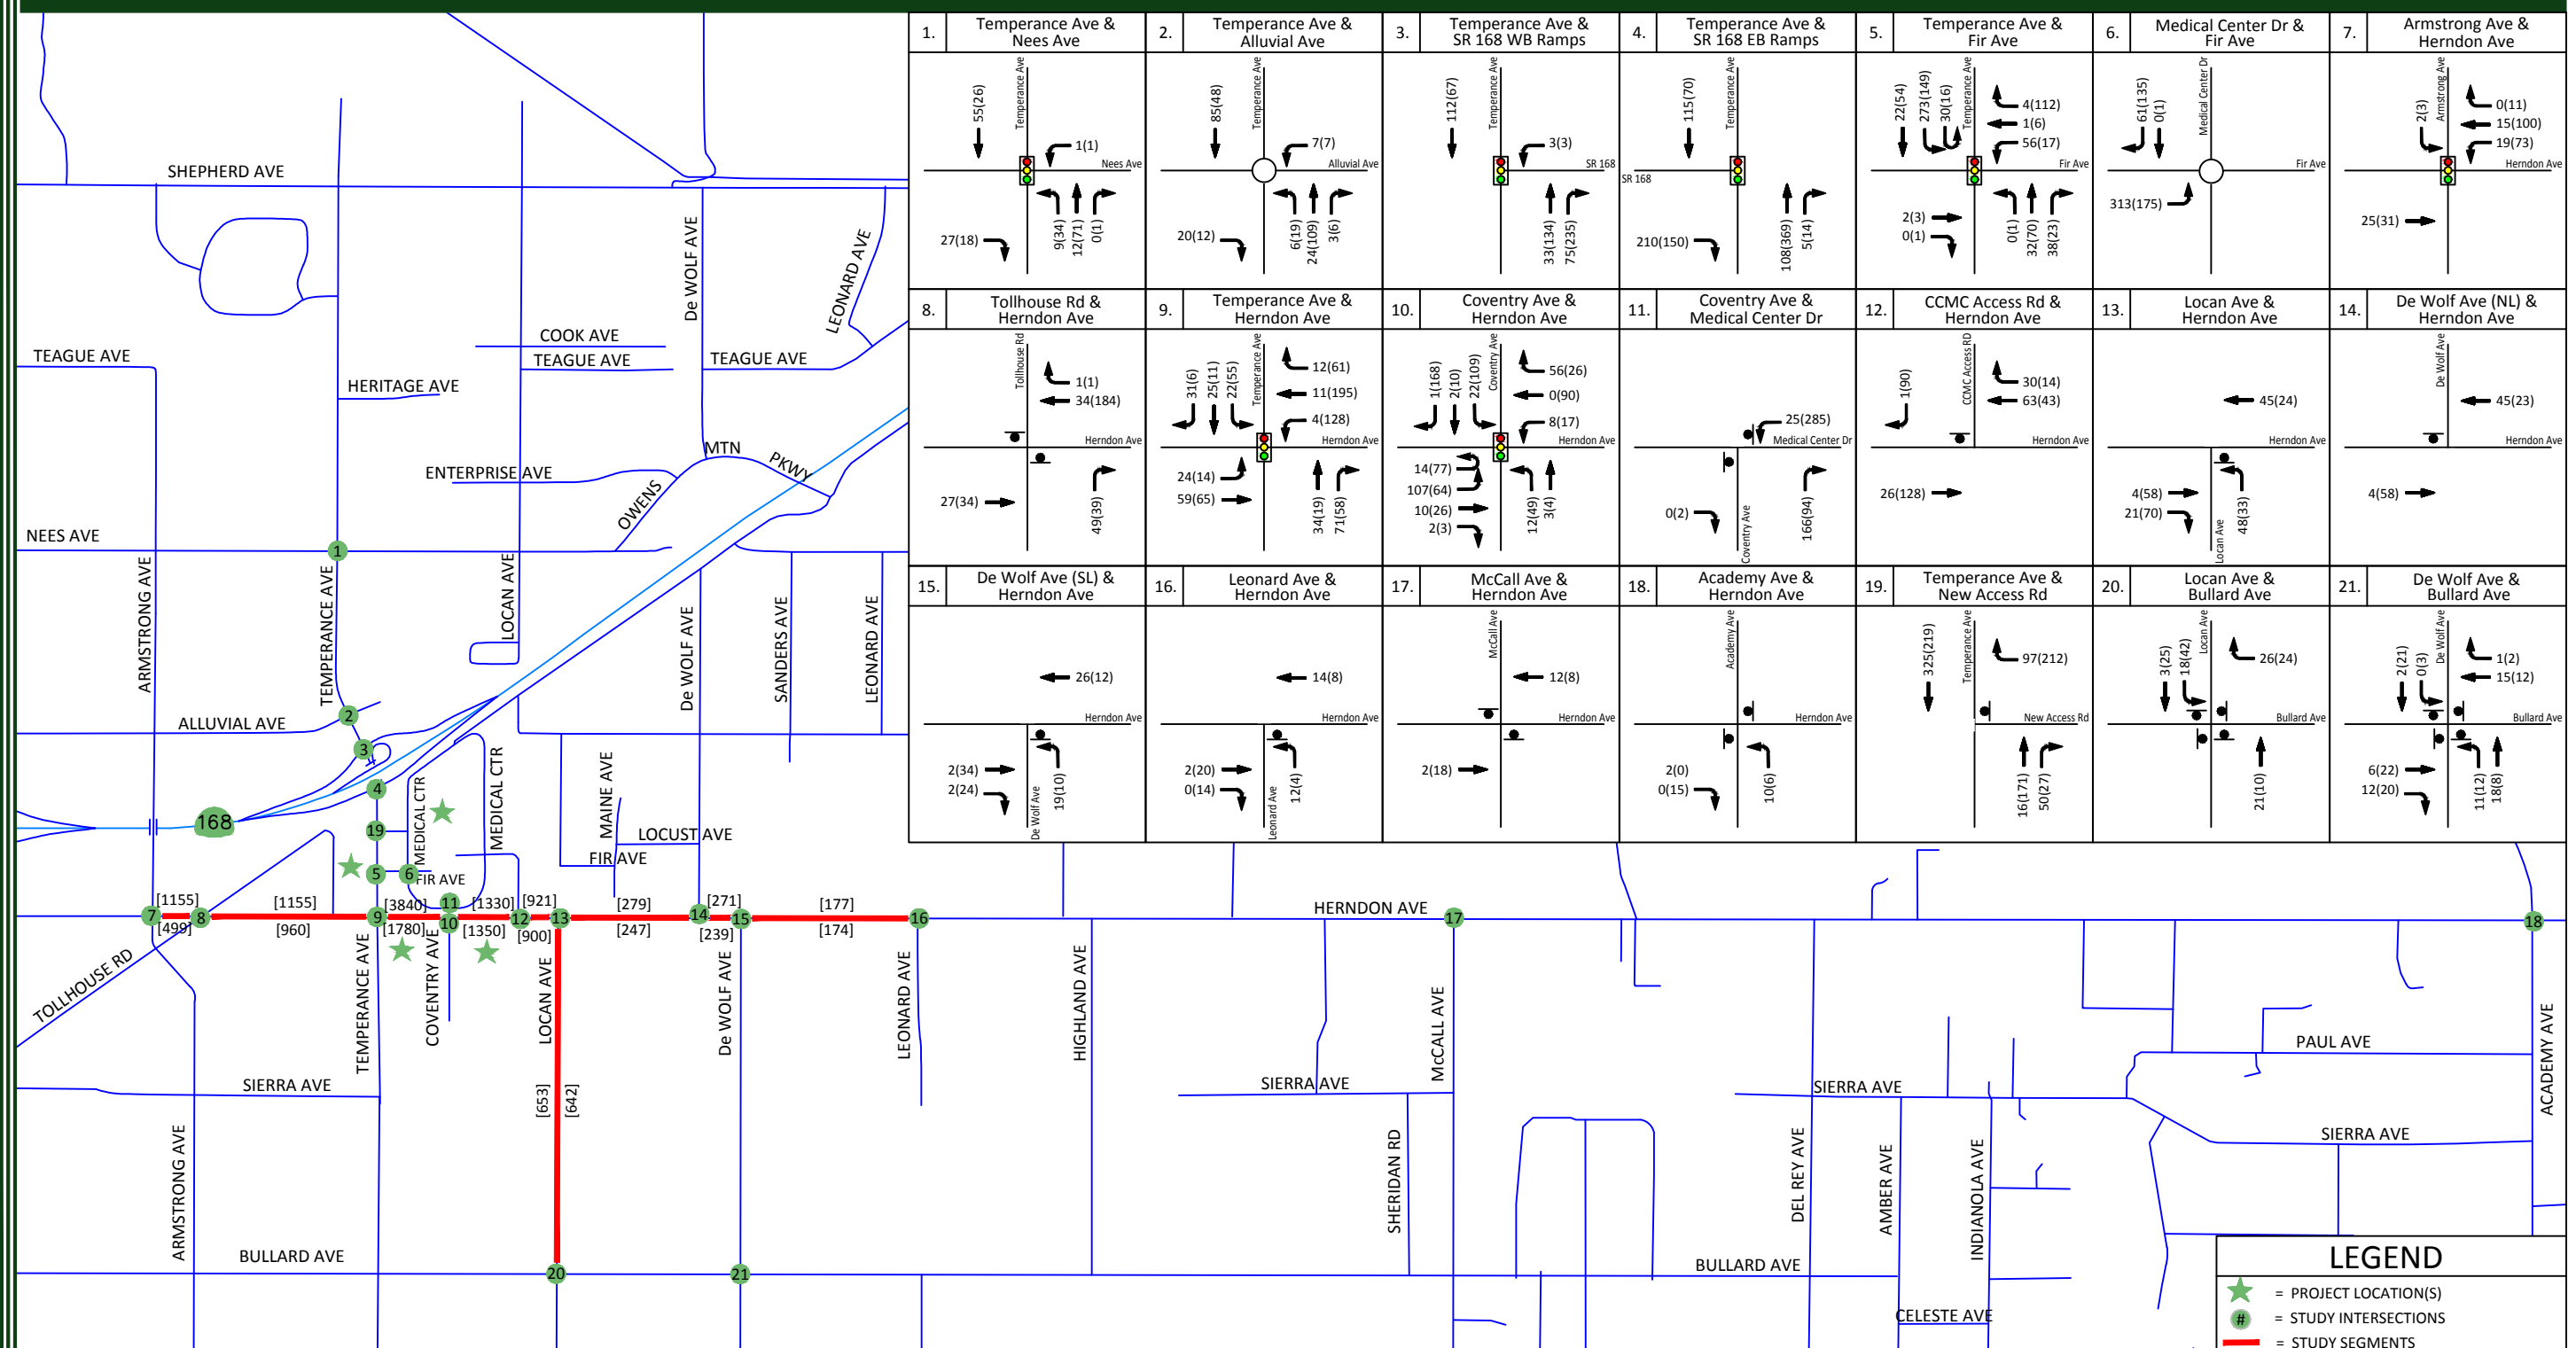

Peak hour traffic signal warrants were prepared for the unsignalized study intersections for the Cumulative Year 2035 plus Project Traffic Conditions scenario. These warrants are found in Appendix J. Under this scenario, the intersections of Herndon Avenue at Tollhouse Road, Herndon Avenue at Locan Avenue, Herndon Avenue at De Wolf Avenue (SL), Herndon Avenue at Leonard Avenue, Herndon Avenue at McCall Avenue, Bullard Avenue at Locan Avenue, and Bullard Avenue at De Wolf Avenue satisfy peak hour signal warrants during both peaks, while the intersection of Herndon Avenue at Academy Avenue satisfies peak hour signal warrants during the PM peak only.

Except for the intersections of Herndon Avenue at Tollhouse Road and Herndon Avenue at Academy Avenue, based on the signal warrants, the intersection operational analysis and traffic engineering judgment, signalization of these intersections is recommended. The intersections of Herndon Avenue at Tollhouse Road and Herndon Avenue at Academy Avenue are projected to function at an acceptable LOS without the need for a traffic signal. It is worth noting that CA MUTCD states “satisfaction of a signal warrant or warrants shall not in itself require the installation of a traffic signal.” Therefore, it is recommended that prior to the installation of a traffic signal at the intersections of Herndon Avenue at Tollhouse Road or Herndon Avenue at Academy Avenue, investigation of CA MUTCD warrants 1, 4, and 7, as applicable, be conducted. On the other hand, the intersection of Herndon Avenue at De Wolf Avenue (north leg) is projected to operate at an unacceptable LOS threshold and implementation of All-STOP controls and the addition of lanes is not projected to improve its LOS to an acceptable level. Therefore, it is recommended that the intersection of Herndon Avenue at De Wolf Avenue (north leg) be signalized.

## Queuing Analysis

Table XV (located in the Cumulative Year 2035 plus Project Scenario) provides a queue length summary for left- and right-turn lanes at the study intersections under all study scenarios. The queuing analyses for the study intersections are contained in the LOS worksheets for the respective scenarios. Appendix A contains the methodologies used to evaluate these intersections.

Queuing analyses were completed using Sim Traffic output information. Synchro provides both 50th and 95th percentile maximum queue lengths in feet. According to the Synchro manual, “the 50th percentile maximum queue is the maximum back of queue on a typical cycle and the 95th percentile queue is the maximum back of queue with 95th percentile volumes.” The queues shown on Table XV are the 95th percentile queue lengths for the respective lane movements.

The Highway Design Manual (HDM) provides guidance for determining deceleration lengths for the left- and right-turn lanes based on design speeds. Per the HDM criteria, “tapers for right-turn lanes are usually unnecessary since the main line traffic need not be shifted laterally to provide space for the right-turn lane. If, in some rare instances, a lateral shift were needed, the approach taper would use the same formula as for a left-turn lane.” Therefore, a bay taper length pursuant to the Caltrans HDM would need to be added as necessary to the recommended storage lengths presented below.

Based on the SimTraffic output files, it is recommended that the storage capacity for the following be considered for the Cumulative Year 2035 plus Project Conditions.

- Nees Avenue at Temperance Avenue
  - Consider increasing the storage capacity of the eastbound right-turn lane to 150 feet
  - Consider increasing the storage capacity of the westbound left-turn lane to 175 feet
  - Consider increasing the storage capacity of the westbound right-turn lane to 100 feet
  - Consider increasing the storage capacity of the northbound left-turn lane to 300 feet
  - Consider increasing the storage capacity of the southbound left-turn lane to 300 feet
  - Consider increasing the storage capacity of the southbound right-turn lane to 200 feet
- SR 168 EB Ramps at Temperance Avenue
  - Consider setting the storage capacity of the eastbound dual left-turn lanes to 475 feet
  - Consider setting the storage capacity of the eastbound dual right-turn lanes to 575 feet
  - Consider increasing the storage capacity of the southbound left-turn lane to 375 feet
- Fir Avenue at Temperance Avenue
  - Consider setting the storage capacity of the eastbound left-turn lane to 200 feet
  - Consider setting the storage capacity of the eastbound right-turn lane to 125 feet
  - Consider increasing the storage capacity of the westbound left-turn lane to 175 feet
  - Consider increasing the storage capacity of the northbound left-turn lane to 175 feet
  - Consider increasing the storage capacity of the northbound right-turn lane to 250 feet
  - Consider increasing the storage capacity of the southbound dual left-turn lanes to 350 feet
  - Consider setting the storage capacity of the southbound right-turn lane to 75 feet

- Herndon Avenue at Armstrong Avenue
  - Consider increasing the storage capacity of the eastbound right-turn lane to 150 feet
  - Consider increasing the storage capacity of the westbound left-turn lane to 200 feet
  - Consider increasing the storage capacity of the northbound left-turn lane to 175 feet
  - Consider increasing the storage capacity of the southbound left-turn lane to 175 feet
  - Consider setting the storage capacity of the southbound right-turn lane to 125 feet
- Herndon Avenue at Temperance Avenue
  - Consider increasing the storage capacity of the eastbound dual left-turn lanes to 300 feet
  - Consider increasing the storage capacity of the eastbound right-turn lane to 275 feet
  - Consider increasing the storage capacity of the westbound right-turn lane to 500 feet
  - Consider increasing the storage capacity of the northbound dual left-turn lanes to 275 feet
  - Consider increasing the storage capacity of the northbound right-turn lane to 250 feet
  - Consider increasing the storage capacity of the southbound dual left-turn lanes to 300 feet
  - Consider setting the storage capacity of the southbound right-turn lane to 275 feet
- Herndon Avenue at Coventry Avenue
  - Consider increasing the storage capacity of the eastbound left-turn lane to 250 feet
  - Consider increasing the storage capacity of the westbound right-turn lane to 225 feet
- Herndon Avenue at Locan Avenue
  - Consider setting the storage capacity of the eastbound right-turn lane to 150 feet
  - Consider setting the storage capacity of the westbound left-turn lane to 200 feet
  - Consider setting the storage capacity of the northbound right-turn lane to 275 feet
- Herndon Avenue at De Wolf Avenue (NL)
  - Consider setting the storage capacity of the eastbound left-turn lane to 125 feet
  - Consider setting the storage capacity of the westbound right-turn lane to 75 feet
  - Consider setting the storage capacity of the southbound right-turn lane to 75 feet
- Herndon Avenue at De Wolf Avenue (SL)
  - Consider setting the storage capacity of the eastbound right-turn lane to 150 feet
  - Consider setting the storage capacity of the westbound left-turn lane to 75 feet
- Herndon Avenue at Leonard Avenue
  - Consider setting the storage capacity of the westbound left-turn lane to 75 feet
- Herndon Avenue at McCall Avenue
  - Consider setting the storage capacity of the eastbound left-turn lane to 175 feet
  - Consider setting the storage capacity of the westbound left-turn lane to 75 feet
  - Consider setting the storage capacity of the northbound left-turn lane to 275 feet
  - Consider setting the storage capacity of the southbound left-turn lane to 75 feet
- Herndon Avenue at Academy Avenue
  - Consider setting the storage capacity of the eastbound right-turn lane to 175 feet
  - Consider setting the storage capacity of the northbound left-turn lane to 100 feet
- New Access Road at Temperance Avenue
  - Utilize a street type approach to minimize impacts to Temperance Avenue
  - Internal driveways to the new access road should not be installed within the first 125 feet measured from the Temperance Avenue right-of-way

Master Plan Expansion of the Clovis Community Medical Center  
Draft Traffic Impact Analysis  
November 8, 2017

- Bullard Avenue at Locan Avenue
  - Consider setting the storage capacity of the eastbound right-turn lane to 100 feet
  - Consider increasing the storage capacity of the northbound left-turn lane to 175 feet
  - Consider setting the storage capacity of the southbound left-turn lane to 300 feet
- Bullard Avenue at De Wolf Avenue
  - Consider setting the storage capacity of the eastbound left-turn lane to 150 feet
  - Consider setting the storage capacity of the eastbound right-turn lane to 150 feet
  - Consider setting the storage capacity of the westbound left-turn lane to 275 feet
  - Consider setting the storage capacity of the northbound left-turn lane to 300 feet
  - Consider setting the storage capacity of the southbound left-turn lane to 175 feet

## Project's Pro-Rata Fair Share of Future Transportation Improvements

The project's equitable fair share impact to all study intersections that are projected to fall below their respective LOS threshold is provided in Table XVI. The project's fair share percentage impacts were calculated pursuant to the Caltrans Guide for the Preparation of Traffic Impact Studies. The Project's pro-rata fair shares were calculated utilizing the Existing, Phase 1 Project Only trip assignment, Phase 2 Project Only trip assignment, and the Cumulative 2035 plus Project volumes. Figure 2 illustrates the Existing traffic volumes. Figures 4 and 10 illustrate the Project only trip assignment to the respective study intersections for Phase 1 and Phase 2 respectively. Figure 11 illustrates the total traffic volumes during the Cumulative Year 2035 plus Project scenario. The critical peak period for the study facilities was determined to be during the PM peak and therefore the PM peak volumes are utilized to determine the Project's pro-rata fair share.

It is recommended that the Project contribute its equitable fair share as listed in Table XVI for the future improvements necessary to maintain an acceptable LOS. However, fair share contributions should only be made for those facilities or portion thereof currently not funded by the responsible agencies roadway impact fee program(s) (as appropriate). For those improvements not presently covered by local and regional roadway impact fee programs, it is recommended that the Project contribute its equitable fair share. Payment of the Project's equitable fair share in addition to the local and regional impact fee programs would satisfy the Project's traffic mitigation measures.

This study does not provide construction costs for the recommended mitigation measures; therefore, if the recommended mitigation measures are implemented, it is recommended that the CCMC work with City of Clovis, County of Fresno and Caltrans staff as appropriate to develop the estimated construction costs.

**Table XVII: Project's Fair Share of the Future Improvements**

| ID | Intersection                         | Existing 2016<br>Traffic Volumes<br>(PM Peak) | Year 2035 + Project<br>Traffic Volumes<br>(PM Peak) | Project PM<br>Peak Hour Trips | Project Fair<br>Share (%) |
|----|--------------------------------------|---|---|-------------------------------|---------------------------|
| 4  | SR 168 EB Ramps / Temperance Avenue  | 2,441   | 4,910   | 1,290                         | 52.25%                    |

## Conclusions and Recommendations

Conclusions and recommendations regarding the proposed Project components are presented below.

### *Existing Traffic Conditions*

- Except for the intersection of SR 168 EB Ramps at Temperance Avenue, all study intersections operate at an acceptable LOS during both the AM and PM peak hours. To improve the LOS at this intersection, it is recommended that a second eastbound left-turn lane be added and that the existing traffic signal be modified to accommodate the added lane.
- Under this scenario, all study segments operate at an acceptable LOS.

### *Existing plus Project Phase 1 Traffic Conditions*

- By this scenario, it is assumed that widening of Herndon Avenue between Temperance Avenue and the south leg of De Wolf Avenue has been completed.
- The Phase 1 of the CCMC (Year 2026) consists of adding a 300,172 square-foot expansion of the existing hospital, 94,392 square feet of Medical Dental Office Building, 150,000 square feet of Shopping Center, and a 150 room Hotel.
- Phase 1 of the CCMC is estimated to generate a maximum of 15,121 daily trips, 756 AM peak hour trips and 1,278 PM peak hour trips.
- Similar to the previous scenario, except for the intersection of SR 168 EB Ramps at Temperance Avenue, all study intersections are projected to operate at an acceptable LOS during both the AM and PM peak hours. To improve the LOS at this intersection, it is recommended that a second eastbound right-turn lane and third northbound thru lane be added and that the existing traffic signal be modified to accommodate the added lane geometrics.
- Under this scenario, all study segments are projected to operate at an acceptable LOS.

### *Near Term plus Project Phase 1 Traffic Conditions*

- The near term projects are estimated to generate 45,938 daily trips, 4,655 AM peak hour trips and 5,267 PM peak hour trips.
- Under this scenario, except for the intersections of SR 168 EB Ramps at Temperance Avenue, Herndon Avenue at Temperance Avenue, and Herndon Avenue at De Wolf Avenue (south leg), all intersections are projected to operate at acceptable LOS during both the AM and PM peak hours. To improve the LOS at each one of the intersections projected to exceed its LOS threshold, it is recommended that the improvement measures recommended under the Existing plus Project Phase 1 Traffic Conditions scenario be implemented along with the following.
  - Herndon Avenue at Temperance Avenue
    - Implement overlap phasing of the westbound right-turn with the southbound left-turn phase
    - Prohibit southbound to northbound U-turns
  - Herndon Avenue at De Wolf Avenue (south leg)
    - Implement All-Way STOP traffic controls

- Of the near term projects, the CCMC Phase 1 Project accounts for only 24.8, 14.0, and 19.5 percent of the total near term project traffic for the daily, AM and PM peak hours, respectively. Therefore, it can be deduced that the mitigation measures presented under this scenario may not be necessary immediately upon completion of the proposed Project.
- Under this scenario, all study segments are projected to operate at an acceptable LOS.

#### *Cumulative Year 2035 No Project Traffic Conditions*

- Under this scenario, several of the study intersections are expected to exceed their respective LOS thresholds. These include the intersections of SR 168 EB Ramps at Temperance Avenue, Herndon Avenue at Armstrong Avenue, Herndon Avenue at Temperance Avenue, Herndon Avenue at Locan Avenue, Herndon Avenue at De Wolf Avenue (north leg), Herndon Avenue at De Wolf Avenue (south leg), Herndon Avenue at Leonard Avenue, Herndon Avenue at McCall Avenue, Herndon Avenue at Academy Avenue, Bullard Avenue at Locan Avenue, and Bullard Avenue at De Wolf Avenue. To improve the LOS at each one of the intersections projected to exceed its LOS threshold, it is recommended that the following improvement measures as presented below and illustrated in Figure 9 be implemented.
  - SR 168 EB Ramps at Temperance Avenue
    - Add a second eastbound left-turn lane
    - Add a second eastbound right-turn lane
    - Add a third northbound thru lane
    - Modify the traffic signal to accommodate the added lane geometrics
  - Herndon Avenue at Armstrong Avenue
    - Add a third westbound thru lane
    - Modify the traffic signal to accommodate the added lane
  - Herndon Avenue at Temperance Avenue
    - Implement overlap phasing of the westbound right-turn with the southbound left-turn phase
    - Prohibit southbound to northbound U-turns
  - Herndon Avenue at Locan Avenue
    - Signalize the intersection
    - Limit pedestrian crosswalks across Herndon Avenue to the east leg of Herndon Avenue
  - Herndon Avenue at De Wolf Avenue (NL)
    - Signalize the intersection
    - Limit pedestrian crosswalks across Herndon Avenue to the west leg of Herndon Avenue
  - Herndon Avenue at De Wolf Avenue (SL)
    - Convert the westbound left-thru lane to a thru lane
    - Add a westbound left-turn lane
    - Signalize the intersection
    - Limit pedestrian crosswalks across Herndon Avenue to the east leg of Herndon Avenue

- Herndon Avenue at Leonard Avenue
  - Convert the westbound left-thru lane to a thru lane
  - Add a westbound left-turn lane
  - Signalize the intersection
  - Limit pedestrian crosswalks across Herndon Avenue to the east leg of Herndon Avenue
- Herndon Avenue at McCall Avenue
  - Convert the eastbound left-thru-right lane to a thru-right lane
  - Convert the westbound left-thru-right lane to a thru-right lane
  - Convert the northbound left-thru-right lane to a thru-right lane
  - Convert the southbound left-thru-right lane to a thru-right lane
  - Add left-turn lanes to all approaches
  - Signalize the intersection
- Herndon Avenue at Academy Avenue
  - Convert the eastbound left-thru-right lane to a left-thru lane
  - Add an eastbound right-turn lane
  - Convert the northbound left-thru-right lane to a thru-right lane
  - Add a northbound left-turn lane
  - Implement All-Way STOP controls
- Bullard Avenue at Locan Avenue
  - Add a second eastbound thru lane
  - Add a second westbound thru lane
  - Convert the southbound left-thru-right lane to a thru-right lane
  - Add a southbound left-turn lane
  - Signalize the intersection
- Bullard Avenue at De Wolf Avenue
  - Add an eastbound left-turn lane
  - Convert the eastbound left-thru-right lane to a thru lane
  - Add an eastbound right-turn lane
  - Convert the westbound left-thru-right lane to a thru-right lane
  - Add a westbound left-turn lane
  - Convert the northbound left-thru-right lane to a thru-right lane
  - Add a northbound left-turn lane
  - Convert the southbound left-thru-right lane to a thru-right lane
  - Add a southbound left-turn lane
  - Signalize the intersection
- Under this scenario, all study segments are projected to operate at an acceptable LOS.

### *Cumulative Year 2035 plus Project Traffic Conditions*

- Phase 2 of the CCMC is estimated to generate a maximum of 14,887 daily trips, 866 AM peak hour trips and 1,374 PM peak hour trips. Therefore Phase 1 and Phase 2 of the CCMC Project are estimated to generate a combined maximum of 30,008 daily trips, 1,622 AM peak hour trips and 2,652 PM peak hour trips.
- Similar to the Cumulative Year 2035 No Project, under this scenario, the intersections of SR 168 EB Ramps at Temperance Avenue, Herndon Avenue at Armstrong Avenue, Herndon Avenue at Temperance Avenue, Herndon Avenue at Locan Avenue, Herndon Avenue at De Wolf Avenue (NL), Herndon Avenue at De Wolf Avenue (SL), Herndon Avenue at Leonard Avenue, Herndon Avenue at McCall Avenue, Herndon Avenue at Academy Avenue, Bullard Avenue at Locan Avenue, and Bullard Avenue at De Wolf Avenue are projected to exceed their respective LOS threshold. For these intersections, it is recommended that the same improvements presented in the Cumulative 2035 No Project Scenario be implemented.
- Further, the intersections of Fir Avenue at Temperance Avenue and Herndon Avenue at Tollhouse Road are also projected to exceed their respective LOS threshold. Specific mitigation measures are further illustrated in Figure 12.
  - Fir Avenue at Temperance Avenue
    - Add a northbound thru lane
    - Modify the traffic signal to accommodate the added lane
  - Herndon Avenue at Tollhouse Road
    - The worst movement is the northbound right. JLB anticipates that as the volume of this movement increases, it will experience a higher peak hour factor in the future, which in turn will improve its LOS to D. Should a higher peak hour factor not materialize, then it is recommended that all truck traffic be prohibited from using Tollhouse Road between Armstrong Avenue and Herndon Avenue.
- Finally, the intersection of the New Access Road at Temperance Avenue is projected to exceed its LOS threshold. However, since this intersection is not projected to meet All-Way STOP or traffic signal warrants, the deficient LOS would be considered adverse but not significant and therefore mitigation measures are not recommended.
- Under this scenario, all study segments are projected to operate at an acceptable LOS.

### *Queuing Analysis*

- It is recommended that the City consider left- and right-turn lane storage lengths as indicated in Table XV.

### *Project Equitable Fair Share Impact Analysis*

- It is recommended that the Project contribute its equitable fair share towards future transportation improvements as presented in Table XVI.

## Study Participants

### JLB Traffic Engineering, Inc. Personnel:

|                             |                 |
|-----------------------------|-----------------|
| Jose Luis Benavides, PE, TE | Project Manager |
| Susana Maciel, EIT          | Engineer I/II   |
| Javier Rios                 | Engineer I/II   |
| Jove Alcazar                | Engineer I/II   |
| Alan Miao, EIT              | Engineer I/II   |
| Veronica Benavides          | Clerical        |

### Persons Consulted:

|                      |                                 |
|----------------------|---------------------------------|
| Bryan Araki          | City of Clovis                  |
| Mike Harrison, PE    | City of Clovis                  |
| Sean Smith, PE       | City of Clovis                  |
| David Padilla        | Caltrans                        |
| Jill Gormley, TE     | City of Fresno                  |
| Harpreet Kooner      | County of Fresno                |
| Tong Xiong           | County of Fresno                |
| Scott B. Odell, AICP | Odell Planning & Research, Inc. |

## APPENDIX A

### Levels of Service Methodology

The description and procedures for calculating capacity and level of service (LOS) are found in the Transportation Research Board, Highway Capacity Manual (HCM). The HCM 2010 represents the research on capacity and quality of service for transportation facilities.

Quality of service requires quantitative measures to characterize operational conditions within a traffic stream. Level of service is a quality measure describing operational conditions within a traffic stream, generally in terms of such service measures as speed and travel time, freedom to maneuver, traffic interruptions, comfort and convenience.

Six levels of service are defined for each type of facility that has analysis procedures available. Letters designate each level of service (LOS), from A to F, with LOS A representing the best operating conditions and LOS F the worst. Each LOS represents a range of operating conditions and the driver's perception of these conditions. Safety is not included in the measures that establish a LOS.

### Urban Streets (Automobile Mode)

The term "urban streets" refers to urban arterials and collectors, including those in downtown areas. Arterial streets are roads that primarily serve longer through trips. However, providing access to abutting commercial and residential land uses is also an important function of arterials. Collector streets provide both land access and traffic circulation within residential, commercial and industrial areas. Their access function is more important than that of arterials, and unlike arterials their operation is not always dominated by traffic signals. Downtown streets are signalized facilities that often resemble arterials. They not only move through traffic but also provide access to local businesses for passenger cars, transit buses, and trucks. Pedestrian conflicts and lane obstructions created by stopping or standing taxicabs, buses, trucks and parking vehicles that cause turbulence in the traffic flow are typical of downtown streets.

### Flow Characteristics

The speed of vehicles on urban streets is influenced by three main factors, street environment, interaction among vehicles and traffic control.

The street environment includes the geometric characteristics of the facility, the character of roadside activity, and adjacent land uses. Thus, the environment reflects the number and width of lanes, type of median, driveway/access point density, spacing between signalized intersections, existence of parking, level of pedestrian and bicyclist activity and speed limit.

The interaction among vehicles is determined by traffic density, the proportion of trucks and buses, and turning movements. This interaction affects the operation of vehicles at intersections and, to a lesser extent, between signals.

Traffic controls (including signals and signs) forces a portion of all vehicles to slow or stop. The delays and speed changes caused by traffic control devices reduce vehicle speeds; however, such controls are needed to establish right-of-way.

## Levels of Service (automobile Mode)

The average travel speed for through vehicles along an urban street is the determinant of the operating level of service (LOS). The travel speed along a segment, section or entire length of an urban street is dependent on the running speed between signalized intersections and the amount of control delay incurred at signalized intersections.

**LOS A** describes primarily free-flow operation. Vehicles are completely unimpeded in their ability to maneuver within the traffic stream. Control delay at signalized intersections is minimal. Travel speeds exceed 85 of the base free flow speed (FFS).

**LOS B** describes reasonably unimpeded operation. The ability to maneuver within the traffic stream is only slightly restricted and control delay at the boundary intersections is not significant. The travel speed is between 67 and 85 percent of the base FFS.

**LOS C** describes stable operations. The ability to maneuver and change lanes in midblock location may be more restricted than at LOS B. Longer queues at the boundary intersections may contribute to lower travel speeds. The travel speed is between 50 and 67 percent of the base FFS.

**LOS D** indicates a less stable condition in which small increases in flow may cause substantial increases in delay and decreases in travel speed. This operation may be due to adverse signal progression, high volumes, inappropriate signal timing, at the boundary intersections. The travel speed is between 40 and 50 percent of the base FFS.

**LOS E** is characterized unstable operation and significant delay. Such operations may be due to some combination of adverse progression, high volume, and inappropriate signal timing at the boundary intersections. The travel speed is between 30 and 40 percent of the base FFS.

**LOS F** is characterized by street flow at extremely low speed. Congestion is likely occurring at the boundary intersections, as indicated by high delay and extensive queuing. The travel speed is 30 percent or less of the base FFS.

**Table A-1: Urban Street Levels of Service (Automobile Mode)**

| Travel Speed as a Percentage of Base Free-Flow Speed (%) | LOS by Critical Volume-to-Capacity Ratio <sup>a</sup> |      |
|--|---|------|
|  | ≤1.0  | >1.0 |
| >85  | A   | F    |
| >67 to 85  | B   | F    |
| >50 to 67  | C   | F    |
| >40 to 50  | D   | F    |
| >30 to 40  | E   | F    |
| ≤30  | F   | F    |

<sup>a</sup> = The Critical volume-to-capacity ratio is based on consideration of the through movement-to-capacity ratio at each boundary intersection in the subject direction of travel. The critical volume-to-capacity ratio is the largest ratio of those considered.

Source: Highway Capacity Manual 2010, Exhibit 16-4. Urban Street LOS Criteria (Automobile Mode)

## Intersection Levels of Service

One of the more important elements limiting, and often interrupting the flow of traffic on a highway is the intersection. Flow on an interrupted facility is usually dominated by points of fixed operation such as traffic signals, stop and yield signs.

### Signalized Intersections – Performance Measures

For signalized intersections, the performance measures include automobile volume-to-capacity ratio, automobile delay, queue storage length, ratio of pedestrian delay, pedestrian circulation area, pedestrian perception score, bicycle delay, and bicycle perception score. LOS is also considered a performance measure. For the automobile mode average control delay per vehicle per approach is determined for the peak hour. A weighted average of control delay per vehicle is then determined for the intersection. A LOS designation is given to the weighted average control delay to better describe the level of operation. A description of LOS for signalized intersections is found in Table A-2.

**Table A-2: Signalized Intersection Level of Service Description (Automobile Mode)**

| Level of Service | Description  | Average Control Delay (seconds per vehicle) |
|------------------|--|---|
| A                | Operations with a control delay of 10 seconds/vehicle or less and a volume-to-capacity ratio no greater than 1.0. This level is typically assigned when volume-to-capacity ratio is and either progression is exceptionally favorable or the cycle length is very short. If it's due to favorable progression, most vehicles arrive during the green indication and travel through the intersection without stopping.  | ≤10   |
| B                | Operations with control delay between 10.1 to 20.0 seconds/vehicle and a volume-to-capacity ratio no greater than 1.0. This level is typically assigned when the volume-to-capacity ratio is low and either progression is highly favorable or the cycle length is short. More vehicles stop than with LOS A.  | >10.0 to 20.0                               |
| C                | Operations with average control delays between 20.1 to 35.0 seconds/vehicle and a volume-to-capacity ratio no greater than 1.0. This level is typically assigned when progression is favorable or the cycle length is moderate. Individual cycle failures (i.e., one or more queued vehicles are not able to depart as a result of insufficient capacity during the cycle) may begin to appear at this level. The number of vehicles stopping is significant, although many vehicles still pass through the intersection without stopping. | >20 to 35                                   |
| D                | Operations with control delay between 35.1 to 55.0 seconds/vehicle and a volume-to-capacity ratio no greater than 1.0. This level is typically assigned when the volume-to-capacity ratio is high and either progression is ineffective or the cycle length is long. Many vehicles stop, and individual cycle failures are noticeable.   | >35 to 55                                   |
| E                | Operations with control delay between 55.1 to 80.0 seconds/vehicle and a volume-to-capacity ratio no greater than 1.0. This level is typically assigned when the volume-to-capacity ratio is high, progression is unfavorable, and the cycle length is long. Individual cycle failures are frequent.   | >55 to 80                                   |
| F                | Operations with unacceptable control delay exceeding 80.0 seconds/vehicle and a volume-to-capacity ratio greater than 1.0. This level is typically assigned when the volume-to-capacity ratio is very high, progression is very poor, and the cycle length is long. Most cycles fail to clear the queue.   | >80   |

## Unsignalized Intersections

The HCM 2010 procedures use control delay as a measure of effectiveness to determine level of service. Delay is a measure of driver discomfort, frustration, fuel consumption, and increased travel time. The delay experienced by a motorist is made up of a number of factors that relate to control, traffic and incidents. Total delay is the difference between the travel time actually experienced and the reference travel time that would result during base conditions, i. e., in the absence of traffic control, geometric delay, any incidents, and any other vehicles. Control delay is the increased time of travel for a vehicle approaching and passing through an unsignalized intersection, compared with a free-flow vehicle if it were not required to slow or stop at the intersection.

### All-Way Stop Controlled Intersections

All-way stop controlled intersections is a form of traffic controls in which all approaches to an intersection are required to stop. Similar to signalized intersections, at all-way stop controlled intersections the average control delay per vehicle per approach is determined for the peak hour. A weighted average of control delay per vehicle is then determined for the intersection as a whole. In other words the delay measured for all-way stop controlled intersections is a measure of the average delay for all vehicles passing through the intersection during the peak hour. A LOS designation is given to the weighted average control delay to better describe the level of operation.

### Two-Way Stop Controlled Intersections

Two-way stop controlled (TWSC) intersections in which stop signs are used to assign the right-of-way, are the most prevalent type of intersection in the United States. At TWSC intersections the stop-controlled approaches are referred as the minor street approaches and can be either public streets or private driveways. The approaches that are not controlled by stop signs are referred to as the major street approaches.

The capacity of movements subject to delay are determined using the "critical gap" method of capacity analysis. Expected average control delay based on movement volume and movement capacity is calculated. A LOS for TWSC intersection is determined by the computed or measured control delay for each minor movement. LOS is not defined for the intersection as a whole for three main reasons: (a) major-street through vehicles are assumed to experience zero delay; (b) the disproportionate number of major-street through vehicles at the typical TWSC intersection skews the weighted average of all movements, resulting in a very low overall average delay from all vehicles; and (c) the resulting low delay can mask important LOS deficiencies for minor movements. Table A-3 provides a description of LOS at unsignalized intersections.

**Table A-3: Unsignalized Intersection Level of Service Description (Automobile Mode)**

| Control Delay (seconds per vehicle) | LOS by Volume-to-Capacity Ratio |             |
|-------------------------------------|---------------------------------|-------------|
|                                     | $v/c \leq 1.0$                  | $v/c > 1.0$ |
| $\leq 10$                           | A                               | F           |
| >10 to 15                           | B                               | F           |
| >15 to 25                           | C                               | F           |
| >25 to 35                           | D                               | F           |
| >35 to 50                           | E                               | F           |
| >50                                 | F                               | F           |

**Subject: Proposed Draft Scope of Work for the Preparation of a Traffic Impact Analysis for the Proposed Clovis Community Medical Center Master Plan Expansion and Herndon Avenue Widening Project in the City of Clovis (JLB Project 006-009)**

Dear Mr. Harrison,

JLB Traffic Engineering, Inc. (JLB) hereby submits this Draft Scope of Work for the preparation of a Traffic Impact Analysis (TIA) for Clovis Community Medical Center Master Plan Expansion. The proposed Project to be evaluated includes two components. The first component is the proposed Clovis Community Medical Center (CCMC) Expansion Project, which is a phased project over the next 20 years. The CCMC expansion plan includes construction of new inpatient bed towers, medical office buildings, a general support building, a cancer center, a central plant and a parking garage, as well as expansion of the emergency department, surgical facilities, materials management and the outpatient community center. In addition, the CCMC project includes the potential development of areas adjacent to the main campus, primarily with retail commercial buildings, as well as a hotel and an assisted living center.

The second Project component is the proposed widening of Herndon Avenue from Temperance Avenue to De Wolf Avenue (South Leg). Herndon Avenue will be widened to six lanes between Temperance Avenue and Coventry Avenue and to four lanes from Coventry Avenue to the south leg of De Wolf Avenue. The widening of Herndon Avenue between Temperance Avenue and the south leg of De Wolf Avenue will include the signalization of Locan Avenue and both intersections of De Wolf Avenue. As needed existing traffic signals within the Herndon Widening Project will be modified to accommodate the proposed lane geometrics. Per information provided to JLB, the Project is consistent with the City of Clovis General Plan. An aerial of the Project vicinity and the conceptual site plan are shown in Exhibits A and B respectively. The purpose of this TIA is to evaluate the potential on and off-site traffic impacts, identify short-term roadway and circulation needs, determine potential mitigation measures, and identify any critical traffic issues that should be addressed in the on-going planning process. In order to evaluate the on and off-site traffic impacts of the proposed project, JLB proposes the following draft scope of work.

#### **Scope of Work**

- Request a Fresno Council of Governments (Fresno COG) traffic forecast model run for the Project (Select Zone Analysis) which will include the Project and the streets to be analyzed. The Fresno COG

**TRAFFIC ENGINEERING, INC.**

(559) 570-8991

*Page | 1*

traffic forecasting model will be used to forecast traffic volumes for the Base Year, Mid Term Year 2026 and Cumulative Year 2035 scenarios.

- JLB will evaluate existing and forecast levels of service (LOS) at the study intersection(s). JLB will use HCM 2010 methodologies within Synchro to perform this analysis for the a.m. and p.m. peak hours. JLB will identify the causes of poor LOS.
- Evaluate onsite circulation and provide recommendations as necessary to improve circulation to the site and within the project site.
- As necessary obtain recent or schedule and conduct new traffic counts at the study facility (ies).
- Perform a site visit to observe existing traffic conditions, especially during the a.m. and p.m. peak hours. Existing roadway conditions, including geometrics and traffic controls, will be verified.
- Forecast trip distribution based on turn count information, input from Fresno COG, and knowledge of the existing and planned circulation network in the vicinity of the project.
- Prepare California Manual on Uniform Traffic Control Devices (CA MUTCD) peak hour signal warrants for un-signalized study intersections.
- JLB will qualitatively analyze existing and planned transit routes in the project's vicinity.
- JLB will qualitatively analyze existing and planned bikeways in the project's vicinity.

#### **Study Scenarios:**

1. Existing traffic conditions;
2. Existing plus Project Phase 1 (2 to 10 Year Plan) traffic conditions with proposed mitigation measures (if any);
3. Near Term (2026) plus Project Phase 1 (2 to 10 Year Plan) traffic conditions with needed improvements (if any);
4. Cumulative Year 2035 No Project traffic conditions with needed improvements (if any); and
5. Cumulative Year 2035 plus Project Phases I and 2 traffic conditions with proposed mitigation measures (if any).

#### **Weekday peak hours to be analyzed:**

1. 7-9 a.m. peak hour
2. 4-6 p.m. peak hour

#### **Study Intersections:**

1. Nees Avenue / Temperance Avenue
2. Alluvial Avenue / Temperance Avenue
3. SR 168 WB Ramps / Temperance Avenue
4. SR 168 EB Ramps / Temperance Avenue
5. Fir Avenue / Temperance Avenue
6. Fir Avenue / Medical Center Drive
7. Herndon Avenue / Armstrong Avenue
8. Herndon Avenue / Tollhouse Road
9. Herndon Avenue / Temperance Avenue
10. Herndon Avenue / Coventry Avenue
11. Medical Center Drive / Coventry Avenue
12. Herndon Avenue / CCMC Access Road (Approximately 570 west of Locan Avenue)
13. Herndon Avenue / Locan Avenue
14. Herndon Avenue / De Wolf Avenue (north leg)

15. Herndon Avenue / De Wolf Avenue (south leg)
16. Hendon Avenue / Leonard Avenue
17. Herndon Avenue / McCall Avenue
18. Herndon Avenue / Academy Avenue

Queuing analysis is included in the proposed scope of work for the study intersection(s) listed above under all study scenarios. This analysis will be utilized to recommend minimum storage lengths for left and right turn lanes at all study intersections.

#### **Study Segments:**

1. Herndon Avenue between Armstrong Avenue and Tollhouse Road
2. Herndon Avenue between Tollhouse Road and Temperance Avenue
3. Herndon Avenue between Temperance Avenue and Coventry Avenue
4. Herndon Avenue between Coventry Avenue and CCMC Access Road
5. Herndon Avenue between CCMC Access Road and Locan Avenue
6. Herndon Avenue between Locan Avenue and De Wolf Avenue (north leg)
7. Herndon Avenue between De Wolf Avenue (north leg) and De Wolf (south Leg)
8. Herndon Avenue between De Wolf (south leg) and Leonard Avenue

#### **Project Only Trip Assignment to the Following State Facilities:**

1. SR 168 at Herndon Avenue
2. SR 168 at Fowler Avenue
3. SR 168 at Temperance Avenue

#### **Access to the Project**

As the overall Project is located at different locations relative to the major street network, access to the Project will differ by general location. The west portion of the Project, located at the northwest corner of Herndon Avenue and Temperance Avenue, is proposed to have access points to Temperance Avenue and Old Temperance Road. Another portion of the Project bounded by Herndon Avenue to the north and Coventry Avenue to the east proposes to have access to Herndon Avenue and Coventry Avenue. A third component of the Project bounded by Herndon Avenue to the north and Coventry Avenue to the west proposes to have access to Herndon Avenue and Coventry Avenue. Finally, the main component of the Clovis Community Medical Center proposes to have two access points to Herndon Avenue and two access points to Temperance Avenue. Of the access points to Herndon Avenue, one is via Coventry Avenue and the second is via CCMC Access Road. Of these the CCMC Access Road to Herndon Avenue is proposed as a right in, right out and left in access. The access points to Temperance Avenue are via Fir Avenue and via a previously approved right-in right-out access point north of Fir Avenue.

#### **Trip Generation**

Trip generation for the proposed Project is based on information provided by the City and the Institute of Transportation Engineers (ITE) reference, *Trip Generation, 9th Edition*. Table I provides the existing trip generation for Clovis Community Medical Center, While Table II provides the Project's trip generation under the Two to Ten Year Plan (Short Term), while Table III provides the trip generation of the Project under the Twenty Year Plan (Long Term Plan), while Table IV provides the combined trip generation of both the short term and long term plans.

**Table I: Existing Land Use Trip Generation**

| Land Use (ITE CODE)                  | TAZ  | Size    | Unit   | Daily |               | A.M. Peak Hour |            |            |            |              | P.M. Peak Hour |            |            |            |              |
|--------------------------------------|------|---------|--------|-------|---------------|----------------|------------|------------|------------|--------------|----------------|------------|------------|------------|--------------|

### Near Term Projects to be Included

We are working with City of Clovis Engineering and Planning staff to identify near term projects in the vicinity of the proposed Project. The near term projects would then be included under the Near Term plus Project Analysis. At this point, the proposed projects to be included in the Near Term analysis are:

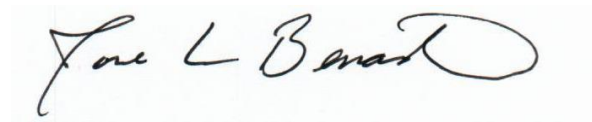

- |   |  |
|---|--|
| 1. Harbor House Apartments  | NEC of Ashlan and Temperance Avenues                       |
| 2. TT 5427 (portion of)   | NWC of Shields and Temperance Avenues                      |
| 3. TT 5447 (portion of)   | NEC of Shields and Temperance Avenues                      |
| 4. TT 5461 (portion of)   | NEC of Dakota and Temperance Avenues                       |
| 5. TT 5472  | NEC of Nees and Locan Avenues                              |
| 6. TT 5550  | SWC of Teague and Armstrong Avenues                        |
| 7. Tract 5592   | SWC of Shields and Locan Avenues                           |
| 8. TT 5717 (portion of)   | SEC of Shields and Shields Avenues                         |
| 9. TT 5836  | NEC of Temperance and Nees Avenues                         |
| 10. TT 6067   | NEC of Shields and Locan Avenues                           |
| 11. TT 6049 (portion of)  | SEC of Temperance and Shepherd Avenues                     |
| 12. TT 6072   | SWC of Teague and DeWolf Avenues                           |
| 13. Larsen Single Family Subdivision  | NWC of Teague and Locan Avenues                            |
| 14. Single Family Subdivision   | NEC of De Wolf Avenue and the Gould Canal                  |
| 15. Single Family Subdivision   | NWQ of Ashlan and De Wolf Avenues                          |
| 16. C-09-106 (portion of)   | SWC of Shields and Armstrong Avenues                       |
| 17. Harlan Ranch Commercial   | NEC of DeWolf and Owens Mountain Parkway                   |
| 18. RT Park, Office and Light Industrial  | Along SR 168 between Temperance and Owens Mountain Parkway |
| 19. Other Near Term Projects the City of Clovis, City of Fresno, County of Fresno or Caltrans has knowledge of and for which it is anticipated that said project(s) is/are projected to be whole or partially built by the Year 2026. The respective City, County and Caltrans as appropriate provides JLB with project details such as a project description, location, proposed land uses with breakdowns and type of residential units and amount of square footages for non-residential uses. |  |

Mr. Harrison  
CCMC Master Plan Expansion TIA Draft Scope of Work  
September 20, 2016

The above scope of work is based on our understanding of this project and our experience with similar Traffic Impact Analysis projects. In the absence of comments by October 12, 2016, we will assume that the above scope of work is acceptable to the agency (ies) that have not submitted any comments to the proposed TIA scope of work. If you have any questions or require additional information, please contact me at (559) 570-8991 or by email at [jbenavides@JLBtraffic.com](mailto:jbenavides@JLBtraffic.com).

Sincerely,

Jose Luis Benavides, P.E., T.E.  
President

CC: Jill Gormley, P.E., City of Fresno  
Harpreet Kooner, County of Fresno

Jose,

Thanks for letting us look at the scope of work for this project. The City of Clovis is agreeable to the scope provided that one additional intersection is studied: the proposed right-in right-out access point to Temperance north of Fir. If you have any questions, please feel free to contact me or other Engineering staff.

*Please note that our counter is open from 8am – 3pm; staff is available for appointments only after 3 pm.*

**Subject:** Clovis Community Medical Center Trip Assignment

Good afternoon,

As was previously requested the attached two figures represent the trip assignment of the Project Only trips for the Clovis Community Medical Center Ten-Year and Long Term Plans. Figure 4 illustrates the Ten-Year (2026) Project Only Trip Assignment while Figure 10 illustrates the Long-Term (2035) Project Only Trip Assignment.

The Project Only Trip Assignments on these two figures have been prepared based on the Fresno COG Select Zone Analysis, Engineering judgement, the City's circulation element and our knowledge of the roadways in the vicinity of the Project. Based on these figures we plan to add to the TIA the analysis of the following intersections and segments.

Intersections:

1. New CCMC Access Road to Temperance
2. Bullard at Locan
3. Bullard at De Wolf

Segments:

1. Locan between Herndon and Bullard

Let us know if you have any further questions or comments to the proposed scope of work. In the absence of comments by December 30<sup>th</sup> it will be assumed that there are no further comments to the scope of work.

Sincerely,

Jose Luis Benavides, P.E., T.E.  
President

**Subject:** RE: Clovis Community Medical Center TIA Draft Scope of Work

Jose,

Thank you for reaching out to the County. County has requested trip distribution for this project. Looking at overall County traffic circulation, County is requesting the following intersections and roadway segments to be included in your analysis: Bullard/DeWolf and Bullard/Locan; roadway segments DeWolf between Herndon and Bullard and Locan between Herndon and Bullard.

If needed, we can revisit this request after the trip distribution is determined for this project.

*Harpreet Kooner*

**Subject:** Clovis Community Medical Center TIA Draft Scope of Work

Good afternoon,

Attached you will find a Draft Scope of Work of the preparation of a Traffic Impact Analysis for the Clovis Community Medical Center Master Plan Expansion and Herndon Avenue widening project for review and comment. We look forward to working with you and other responsible agencies to finalize the draft scope of work for the TIA.

Sincerely,

Jose Luis Benavides, P.E., T.E.  
President

---

Susana,  
I spoke with Jose about this methodology this morning. The City accepts the proposal and looks forward to reviewing the updated TIS. If you have any questions, please feel free to contact me or other Engineering staff.

*Please note that our counter is open from 8am – 3pm; staff is available for appointments only after 3 pm.*

**Subject:** CCMC TIA: Projected Growth Rate

Good afternoon Mr. Smith,

JLB has determined the growth rate for roadway segments at the intersections of Bullard Avenue at Locan Avenue and Bullard Avenue at DeWolf Avenue. Based on Base Year 2016 and Cumulative Year 2035 No Project Daily Volumes, the average growth rate was found to be 4.3% (see Table I below).

Table I: Projected Growth Rate

| Segment         | Limits                            | Base Year 2016 Daily Volumes |       |       | Cumulative Year 2035 No Project Daily Volumes |       |       | % Growth |
|-----------------|-----------------------------------|------------------------------|-------|-------|---|-------|-------|----------|
|                 |                                   | NB/EB                        | SB/WE | Total | NB/EB   | SB/WE | Total |          |
| Bullard Avenue  | Temperance Avenue to Locan Avenue | 3052                         | 3155  | 6207  | 3634  | 6402  | 10036 | 2.4%     |
| Locan Avenue    | Bullard Avenue to Barstow Avenue  | 469                          | 447   | 916   | 1614  | 1370  | 2984  | 6.1%     |
| Bullard Avenue  | Locan Avenue to DeWolf Avenue     | 2800                         | 2886  | 5686  | 6581  | 8144  | 14725 | 4.9%     |
| DeWolf Avenue   | Herndon Avenue to Bullard Avenue  | 795                          | 789   | 1584  | 1751  | 1367  | 3118  | 3.4%     |
| DeWolf Avenue   | Bullard Avenue to Barstow Avenue  | 1726                         | 1665  | 3391  | 5560  | 4504  | 10064 | 5.6%     |
| Bullard Avenue  | DeWolf Avenue to Leonard Avenue   | 1860                         | 1888  | 3748  | 3363  | 4254  | 7617  | 3.6%     |
| Average Growth: |                                   |                              |       |       |   |       |       | 4.3%     |

With the above in mind, JLB obtained turning movement counts for the intersection of Bullard Avenue at Locan Avenue (dated 2009) and will proceed to use the growth rate of 4.3% to expand those values to existing turning movement counts for that intersection as well as the intersection of Bullard Avenue and DeWolf Avenue and the segment of Bullard Avenue between Locan Avenue and DeWolf Avenue.

In the absence of comments by Friday, March 3, 2017, it will be assumed that utilizing a growth rate of 4.3% for the above mentioned (intersections and segment) is acceptable to the City and we will proceed with the preparation of the Traffic Impact Analysis report.

Best,

**Subject: [Revised](#) Traffic Modeling Request for the Preparation of a Traffic Impact Analysis for the Proposed Master Plan Expansion of the Clovis Community Medical Center in the City of Clovis (JLB Project 006-009)**

Dear Mr. Han,

JLB Traffic Engineering, Inc. (JLB) hereby requests traffic modeling for the project described below. [The purpose of this revision is to correct the land use and trip generation for the 2 to 10 year plan.](#) The Project to be evaluated includes two components. The first component is the proposed Clovis Community Medical Center (CCMC) Expansion Project, which is a phased project over the next 20 years. The CCMC expansion plan includes construction of new inpatient bed towers, medical office buildings, a general support building, a cancer center, a central plant and a parking garage, as well as expansion of the emergency department, surgical facilities, materials management and the outpatient community center. In addition, the CCMC project includes the potential development of areas adjacent to the main campus, primarily with retail commercial buildings, as well as a hotel and an assisted living center.

The second project component is the proposed widening of Herndon Avenue from Temperance Avenue to De Wolf Avenue (South Leg). Per information provided to JLB, the Project is consistent with the City of Clovis General Plan. An aerial of the Project vicinity and the conceptual site plan are shown in Exhibits A and B respectively.

### Scenarios:

The following scenarios are requested:

1. Base Year 2016 (with Link and TAZ modifications);
2. Short Term Year 2026 Plus Project Phase I select zone analysis (with link and TAZ modifications);
3. Cumulative Year 2035 No Project (with Link and TAZ modifications);
4. Cumulative Year 2035 plus Project Phases I and 2 select zone analysis (with Link and TAZ modifications); and
5. Differences between model runs 3 and I and 4 and I above.

## Changes and/or additions to the Model Network or TAZ Zones

### LINK MODIFICATIONS (All Scenarios):

1. Add Highland Avenue between Nees Avenue and Alluvial Avenue
  - a. Number of lanes: Two lanes, one in each direction
  - b. Street classification: Local Collector
  - c. Speed: 30 MPH
2. Add Tollhouse Road between Herndon Avenue and the north terminus of Old Temperance Road at a point approximately 2,000 feet to the northeast
  - a. Number of lanes: Two lanes one in each direction
  - b. Street classification: Local Collector
  - c. Speed: 30 MPH
3. Add Fir Avenue (approximately 350 feet in length) between Temperance Avenue and Medical Center Drive West
  - a. Number of lanes: Four lanes (divided), two in each direction
  - b. Street classification: Local Collector
  - c. Speed: 30 MPH
4. Add Coventry Avenue (approximately 100 feet in length) between Herndon Avenue and Medical Center Drive
  - a. Number of lanes: Four lanes, two in each direction
  - b. Street classification: Local Collector
  - c. Speed: 25 MPH
5. Add Coventry Avenue between Herndon Avenue and a point approximately 1,000 feet to the south
  - a. Number of lanes: Two lanes, one in each direction
  - b. Street classification: Local
  - c. Speed: 25 MPH
6. Modify Locan Avenue between Shepherd Avenue and Nees Avenue to include two lanes (one in each direction).
7. Modify Fowler Avenue between Bullard Avenue and Sierra Avenue to four lanes (two lanes in each direction). There is a small segment in the southbound direction for which the base year 2016 model has one lane where two exist.
8. Add Medical Center Drive East and West to completely encircle the Medical Center Complex
  - a. Number of lanes: Two lanes, one in each direction
  - b. Street classification: Local Collector
  - c. Speed: 30 MPH
9. Extend Tollhouse Road to meet Medical Center Drive East
  - a. Number of lanes: Two lanes one in each direction
  - b. Street classification: Collector
  - c. Speed: 30 MPH

10. Add Medical Center Drive East and West completely encircle the Medical Center Complex
  - a. Number of lanes: Two lanes one in each direction
  - b. Street classification: Local Collector
  - c. Speed: 30 MPH

**LINK MODIFICATIONS (Base Year 2016 and Mid Term Year 2026 Scenarios):**

1. Modify Fowler Avenue between Herndon Avenue and Alluvial Avenue to four lanes (two lanes in each direction).
2. Modify Armstrong Avenue between Herndon Avenue and Alluvial Avenue to two lanes (one lane in each direction).
3. Modify Herndon Avenue between Fowler Avenue and Armstrong Avenue to six lanes (three lanes in each direction).
4. Modify Herndon Avenue between Armstrong Avenue and a point one quarter mile to the east to include three lanes in the eastbound direction.
5. Modify Herndon Avenue between Temperance Avenue and a point one quarter mile to the west to include three lanes in the westbound direction.
6. Extend Alluvial Avenue from its intersection with Temperance Avenue easterly to a point approximately 700 feet east to include:
  - a. Number of lanes: Two lanes (one in each direction)
  - b. Street classification: Arterial
  - c. Speed: 40 MPH

**LINK MODIFICATIONS (Base Year 2016 and 2026 Scenarios):**

1. Modify De Wolf Avenue between Bullard Avenue and Barstow Avenue to two lanes (one lanes in each direction).
2. Add Leonard Avenue between Nees Avenue and Alluvial Avenue
  - a. Number of lanes: Two lanes one in each direction
  - b. Street classification: Local Collector
  - c. Speed: 30 MPH

**LINK MODIFICATIONS (Year 2026 and Year 2035 plus and No Project Scenarios Only):**

1. Add Road A between Temperance Avenue and Medical Center Drive
  - a. Number of lanes: Two lanes (one in each direction)
  - b. Street classification: Local Collector
  - c. Speed: 30 MPH

**LINK MODIFICATIONS (Year 2026 and Year 2035 plus Project Scenarios Only):**

1. Modify Herndon Avenue between Temperance Avenue and Coventry Road
  - a. Number of lanes: six lanes (three in each direction)

- b. Street classification: Arterial
- c. Speed: 45 MPH
- 2. Modify Herndon Avenue between Coventry Road and South Leg of De Wolf Avenue
  - a. Number of lanes: four lanes (two in each direction)
  - b. Street classification: Arterial
  - c. Speed: 45 MPH

**TAZ MODIFICATIONS (Base Year 2016 and Mid Term Year 2026 Scenarios):**

- 1. Add a connector from TAZ 265 to Leonard Avenue;

**TAZ MODIFICATIONS (All Scenarios):**

- 1. Add a connector from TAZ 1833 to Nees Avenue;
- 2. Add connectors from TAZ 671 to Leonard Avenue, and Highland Avenue;
- 3. Add a connector from TAZ 1834 to Highland Avenue;
- 4. Split TAZ number 264 into two (2) new TAZ zones as follows:
  - a. 264A bounded by Nees Avenue to the north, Temperance Avenue to the west, the canal to the south, and Locan Avenue to the east, with connectors to Nees Avenue, Temperance Avenue, and Locan Avenue.
  - b. 264B bounded by the Canal to the north, Temperance Avenue to the west, and SR 168 to the south. Add TAZ one TAZ connector to Alluvial Avenue.
- 5. Add a connector from TAZ 1724 to Tollhouse Road;
- 6. Add connectors from TAZ 669 to Tollhouse Road and Temperance Avenue.
- 7. Split TAZ number 670 to create three TAZs as follows:
  - a. 670A bounded by SR 168 to the north, TAZ 669 to the west, Herndon Avenue to the south, and Temperance Avenue to the east, with connectors to Herndon Avenue, Temperance Avenue and Tollhouse Avenue.
  - b. 670B bounded by SR 168 to the north, Temperance Avenue to the west, Herndon Avenue to the south, and irrigation canal to the east, with connectors to Medical Center Drive East, Medical Center Drive West, and Medical Drive North.
  - c. 670C is the remainder of TAZ 670 east of the canal, with connectors to Nees Avenue.
- 8. Split TAZ number 732 to create four TAZs as follows:
  - a. 732A bounded by Sierra Avenue Alignment to the south, Temperance to the west, Locan Avenue to the east, and the north edge of the existing residential and Cedarwood Elementary School to the North. TAZ 732A should have connectors to Temperance Avenue, Locan Avenue and to the south terminus of Coventry Avenue. Any portions of land remaining from original TAZ 732 after TAZ 732 B through D are created should be added to TAZ 732A.

- b. 732B bounded by Herndon Avenue to the north, Temperance Avenue to the west, the existing residential to the south, the west boundary of TAZ 732D to the east. TAZ 732B should have connectors to Herndon Avenue and to Coventry Avenue.
  - c. 732C bounded to the west at a point approximately 350 feet west of Coventry Avenue, Herndon to the north, Coventry Avenue to the east, and the existing residential to the south. TAZ 732C should have connectors to Herndon Avenue and Coventry Avenue. TAZ 732C shall retain the existing land uses which are not part of the CCMC.
  - d. 732D bound to the west by Coventry Avenue, Herndon Avenue to the north, a point approximately 870 feet to the east of Coventry Avenue and the north boundary of the Cedarwood Elementary School to the south. TAZ 732D should have connectors to Herndon Avenue and Coventry Avenue.
9. Modify TAZ number 732 as follow:
- e. Delete the connector to Herndon Avenue;
  - f. Add a connector to the south terminus of Coventry; and
  - g. Add a connector to Temperance Avenue.

**(Modifications are further illustrated in Exhibit C)**

### ***Trip Generation***

Trip generation for the proposed Project is based on information provided by the developer and the Institute of Transportation Engineers (ITE) reference, *Trip Generation, 9th Edition*. Table I below provides the trip generation for the Project under the Two to Ten Year Plan (Short Term), while Table II provides the trip generation of the Project under the Twenty Year Plan (Long Term Plan), while Table III provides the combined trip generation of both the short term and long term plans.

**Table I: Existing Land Use Trip Generation**

| Land Use (ITE CODE)                  | TAZ  | Size    | Unit   | Daily |               | A.M. Peak Hour |            |            |            |              | P.M. Peak Hour |            |            |            |              |

Mr. Han

Fresno COG Modeling Request (Project 006-009)

~~September 29~~ October 3, 2016

Since the City of Clovis is our Client we have assumed that Fresno COG will complete this modeling work at no cost to JLB. If this is not the case, please let us know ASAP so that we may communicate this with City of Clovis staff. Our contact person at the City of Clovis is Mr. Bryan Araki, If you have any questions or require additional information, please contact me at (559) 570-8991 or by email at [jbenavides@JLBtraffic.com](mailto:jbenavides@JLBtraffic.com).

Sincerely,

Jose Luis Benavides, P.E., T.E.

President

cc: Muyi Zhou, Senior Regional Planner

**Subject: Traffic Modeling Request for the Preparation of a Traffic Impact Analysis for the Proposed Master Plan Expansion of the Clovis Community Medical Center in the City of Clovis (JLB Project 006-009)**

Dear Mr. Han,

JLB Traffic Engineering, Inc. (JLB) hereby requests traffic modeling for the project described below. The Project to be evaluated includes two components. The first component is the proposed Clovis Community Medical Center (CCMC) Expansion Project, which is a phased project over the next 20 years. The CCMC expansion plan includes construction of new inpatient bed towers, medical office buildings, a general support building, a cancer center, a central plant and a parking garage, as well as expansion of the emergency department, surgical facilities, materials management and the outpatient community center. In addition, the CCMC project includes the potential development of areas adjacent to the main campus, primarily with retail commercial buildings, as well as a hotel and an assisted living center.

The second project component is the proposed widening of Herndon Avenue from Temperance Avenue to De Wolf Avenue (South Leg). Per information provided to JLB, the Project is consistent with the City of Clovis General Plan. An aerial of the Project vicinity and the conceptual site plan are shown in Exhibits A and B respectively.

#### **Scenarios:**

The following scenarios are requested:

1. Base Year 2016 (with Link and TAZ modifications);
2. Short Term Year 2026 Plus Project Phase I select zone analysis (with link and TAZ modifications);
3. Cumulative Year 2035 No Project (with Link and TAZ modifications);
4. Cumulative Year 2035 plus Project Phases I and 2 select zone analysis (with Link and TAZ modifications); and
5. Differences between model runs 3 and I and 4 and I above.

## Changes and/or additions to the Model Network or TAZ Zones

### LINK MODIFICATIONS (All Scenarios):

1. Add Highland Avenue between Nees Avenue and Alluvial Avenue
  - a. Number of lanes: Two lanes, one in each direction
  - b. Street classification: Local Collector
  - c. Speed: 30 MPH
2. Add Tollhouse Road between Herndon Avenue and the north terminus of Old Temperance Road at a point approximately 2,000 feet to the northeast
  - a. Number of lanes: Two lanes one in each direction
  - b. Street classification: Local Collector
  - c. Speed: 30 MPH
3. Add Fir Avenue (approximately 350 feet in length) between Temperance Avenue and Medical Center Drive West
  - a. Number of lanes: Four lanes (divided), two in each direction
  - b. Street classification: Local Collector
  - c. Speed: 30 MPH
4. Add Coventry Avenue (approximately 100 feet in length) between Herndon Avenue and Medical Center Drive
  - a. Number of lanes: Four lanes, two in each direction
  - b. Street classification: Local Collector
  - c. Speed: 25 MPH
5. Add Coventry Avenue between Herndon Avenue and a point approximately 1,000 feet to the south
  - a. Number of lanes: Two lanes, one in each direction
  - b. Street classification: Local
  - c. Speed: 25 MPH
6. Modify Locan Avenue between Shepherd Avenue and Nees Avenue to include two lanes (one in each direction).
7. Modify Fowler Avenue between Bullard Avenue and Sierra Avenue to four lanes (two lanes in each direction). There is a small segment in the southbound direction for which the base year 2016 model has one lane where two exist.
8. Add Medical Center Drive East and West to completely encircle the Medical Center Complex
  - a. Number of lanes: Two lanes, one in each direction
  - b. Street classification: Local Collector
  - c. Speed: 30 MPH
9. Extend Tollhouse Road to meet Medical Center Drive East
  - a. Number of lanes: Two lanes one in each direction
  - b. Street classification: Collector
  - c. Speed: 30 MPH

10. Add Medical Center Drive East and West completely encircle the Medical Center Complex
  - a. Number of lanes: Two lanes one in each direction
  - b. Street classification: Local Collector
  - c. Speed: 30 MPH

**LINK MODIFICATIONS (Base Year 2016 and Mid Term Year 2026 Scenarios):**

1. Modify Fowler Avenue between Herndon Avenue and Alluvial Avenue to four lanes (two lanes in each direction).
2. Modify Armstrong Avenue between Herndon Avenue and Alluvial Avenue to two lanes (one lane in each direction).
3. Modify Herndon Avenue between Fowler Avenue and Armstrong Avenue to six lanes (three lanes in each direction).
4. Modify Herndon Avenue between Armstrong Avenue and a point one quarter mile to the east to include three lanes in the eastbound direction.
5. Modify Herndon Avenue between Temperance Avenue and a point one quarter mile to the west to include three lanes in the westbound direction.
6. Extend Alluvial Avenue from its intersection with Temperance Avenue easterly to a point approximately 700 feet east to include:
  - a. Number of lanes: Two lanes (one in each direction)
  - b. Street classification: Arterial
  - c. Speed: 40 MPH

**LINK MODIFICATIONS (Base Year 2016 and 2026 Scenarios):**

1. Modify De Wolf Avenue between Bullard Avenue and Barstow Avenue to two lanes (one lanes in each direction).
2. Add Leonard Avenue between Nees Avenue and Alluvial Avenue
  - a. Number of lanes: Two lanes one in each direction
  - b. Street classification: Local Collector
  - c. Speed: 30 MPH

**LINK MODIFICATIONS (Year 2026 and Year 2035 plus and No Project Scenarios Only):**

1. Add Road A between Temperance Avenue and Medical Center Drive
  - a. Number of lanes: Two lanes (one in each direction)
  - b. Street classification: Local Collector
  - c. Speed: 30 MPH

**LINK MODIFICATIONS (Year 2026 and Year 2035 plus Project Scenarios Only):**

1. Modify Herndon Avenue between Temperance Avenue and Coventry Road
  - a. Number of lanes: six lanes (three in each direction)

- b. Street classification: Arterial
  - c. Speed: 45 MPH
2. Modify Herndon Avenue between Coventry Road and South Leg of De Wolf Avenue
- a. Number of lanes: four lanes (two in each direction)
  - b. Street classification: Arterial
  - c. Speed: 45 MPH

**TAZ MODIFICATIONS (Base Year 2016 and Mid Term Year 2026 Scenarios):**

- 1. Add a connector from TAZ 265 to Leonard Avenue;

**TAZ MODIFICATIONS (All Scenarios):**

- 1. Add a connector from TAZ 1833 to Nees Avenue;
- 2. Add connectors from TAZ 671 to Leonard Avenue, and Highland Avenue;
- 3. Add a connector from TAZ 1834 to Highland Avenue;
- 4. Split TAZ number 264 into two (2) new TAZ zones as follows:
  - a. 264A bounded by Nees Avenue to the north, Temperance Avenue to the west, the canal to the south, and Locan Avenue to the east, with connectors to Nees Avenue, Temperance Avenue, and Locan Avenue.
  - b. 264B bounded by the Canal to the north, Temperance Avenue to the west, and SR 168 to the south. Add TAZ one TAZ connector to Alluvial Avenue.
- 5. Add a connector from TAZ 1724 to Tollhouse Road;
- 6. Add connectors from TAZ 669 to Tollhouse Road and Temperance Avenue.
- 7. Split TAZ number 670 to create three TAZs as follows:
  - a. 670A bounded by SR 168 to the north, TAZ 669 to the west, Herndon Avenue to the south, and Temperance Avenue to the east, with connectors to Herndon Avenue, Temperance Avenue and Tollhouse Avenue.
  - b. 670B bounded by SR 168 to the north, Temperance Avenue to the west, Herndon Avenue to the south, and irrigation canal to the east, with connectors to Medical Center Drive East, Medical Center Drive West, and Medical Drive North.
  - c. 670C is the remainder of TAZ 670 east of the canal, with connectors to Nees Avenue.
- 8. Split TAZ number 732 to create four TAZs as follows:
  - a. 732A bounded by Sierra Avenue Alignment to the south, Temperance to the west, Locan Avenue to the east, and the north edge of the existing residential and Cedarwood Elementary School to the North. TAZ 732A should have connectors to Temperance Avenue, Locan Avenue and to the south terminus of Coventry Avenue. Any portions of land remaining from original TAZ 732 after TAZ 732 B through D are created should be added to TAZ 732A.

- b. 732B bounded by Herndon Avenue to the north, Temperance Avenue to the west, the existing residential to the south, the west boundary of TAZ 732D to the east. TAZ 732B should have connectors to Herndon Avenue and to Coventry Avenue.
  - c. 732C bounded to the west at a point approximately 350 feet west of Coventry Avenue, Herndon to the north, Coventry Avenue to the east, and the existing residential to the south. TAZ 732C should have connectors to Herndon Avenue and Coventry Avenue. TAZ 732C shall retain the existing land uses which are not part of the CCMC.
  - d. 732D bound to the west by Coventry Avenue, Herndon Avenue to the north, a point approximately 870 feet to the east of Coventry Avenue and the north boundary of the Cedarwood Elementary School to the south. TAZ 732D should have connectors to Herndon Avenue and Coventry Avenue.
9. Modify TAZ number 732 as follow:
- e. Delete the connector to Herndon Avenue;
  - f. Add a connector to the south terminus of Coventry; and
  - g. Add a connector to Temperance Avenue.

**(Modifications are further illustrated in Exhibit C)**

### ***Trip Generation***

Trip generation for the proposed Project is based on information provided by the developer and the Institute of Transportation Engineers (ITE) reference, *Trip Generation, 9th Edition*. Table I below provides the trip generation for the Project under the Two to Ten Year Plan (Short Term), while Table II provides the trip generation of the Project under the Twenty Year Plan (Long Term Plan), while Table III provides the combined trip generation of both the short term and long term plans.

**Table I: Existing Land Use Trip Generation**

| Land Use (ITE CODE)                  | TAZ  | Size    | Unit   | Daily |               | A.M. Peak Hour |            |            |            |              | P.M. Peak Hour |            |            |            |              |

Mr. Han  
Fresno COG Modeling Request (Project 006-009)  
September 20, 2016

Since the City of Clovis is our Client we have assumed that Fresno COG will complete this modeling work at no cost to JLB. If this is not the case, please let us know ASAP so that we may communicate this with City of Clovis staff. Our contact person at the City of Clovis is Mr. Bryan Araki, If you have any questions or require additional information, please contact me at (559) 570-8991 or by email at [jbenavides@JLBtraffic.com](mailto:jbenavides@JLBtraffic.com).

Sincerely,

Jose Luis Benavides, P.E., T.E.

President

cc: Mui Zhou, Senior Regional Planner

Level of Service (LOS) Method: Delay & v/c (HCM 2010).

Roundabout LOS Method: Same as Sign Control.

Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement

LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).

Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 2010).

Roundabout Capacity Model: SIDRA Standard.

SIDRA Standard Delay Model is used. Control Delay includes Geometric Delay.

Gap-Acceptance Capacity: SIDRA Standard (Akçelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Level of Service (LOS) Method: Delay & v/c (HCM 2010).

Roundabout LOS Method: Same as Sign Control.

Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement

LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).

Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 2010).

Roundabout Capacity Model: SIDRA Standard.

SIDRA Standard Delay Model is used. Control Delay includes Geometric Delay.

Gap-Acceptance Capacity: SIDRA Standard (Akçelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Level of Service (LOS) Method: Delay & v/c (HCM 2010).

Roundabout LOS Method: Same as Sign Control.

Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement

LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).

Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 2010).

Roundabout Capacity Model: SIDRA Standard.

SIDRA Standard Delay Model is used. Control Delay includes Geometric Delay.

Gap-Acceptance Capacity: SIDRA Standard (Akçelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Level of Service (LOS) Method: Delay & v/c (HCM 2010).

Roundabout LOS Method: Same as Sign Control.

Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement

LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).

Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 2010).

Roundabout Capacity Model: SIDRA Standard.

SIDRA Standard Delay Model is used. Control Delay includes Geometric Delay.

Gap-Acceptance Capacity: SIDRA Standard (Akçelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Level of Service (LOS) Method: Delay & v/c (HCM 2010).

Roundabout LOS Method: Same as Sign Control.

Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement

LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).

Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 2010).

Roundabout Capacity Model: SIDRA Standard.

SIDRA Standard Delay Model is used. Control Delay includes Geometric Delay.

Gap-Acceptance Capacity: SIDRA Standard (Akçelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Level of Service (LOS) Method: Delay & v/c (HCM 2010).

Roundabout LOS Method: Same as Sign Control.

Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement

LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).

Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 2010).

Roundabout Capacity Model: SIDRA Standard.

SIDRA Standard Delay Model is used. Control Delay includes Geometric Delay.

Gap-Acceptance Capacity: SIDRA Standard (Akçelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

## Peak Hour Warrant (Rural Areas)

Existing - AM (PM) Peak Hour  
Intersection: Tollhouse Road at Herndon Avenue

**Figure 4C-4. Warrant 3, Peak Hour (70% Factor)**  
(COMMUNITY LESS THAN 10,000 POPULATION OR ABOVE 40 MPH ON MAJOR STREET)

Tollhouse Rd  
Highest Approach  
Volume = 37 (53) VPH

\*Note: 100 vph applies as the lower threshold volume for a minor-street approach with two or more lanes and 75 vph applies as the lower threshold volume for a minor-street approach with one lane.

Herndon Ave Total Volume = 1090 (1341) VPH

☀ AM Peak Hour Volume – Signal Warrant is Not Met

★ PM Peak Hour Volume – Signal Warrant is Not Met

# Executive Summary

This Water Supply Assessment (WSA) has been prepared for the City of Clovis, a California General Law city, which will exercise its independent judgment in evaluating the adequacy of available water supplies for the proposed Clovis Community Medical Center Expansion Project (Project), located in the City of Clovis.

California Water Code §10910 requires the water provider, in this case the City of Clovis, to prepare a WSA for projects that propose to construct projects that meet one or more of three trigger levels for planned water consumption, each of which is set forth in the Water Code. This Project includes more than 250,000 SF of office space, and therefore meets one of the trigger levels. This WSA evaluates whether the total projected water supplies available during normal, dry, and multi-dry water years over a 20-year planning horizon will meet the projected water demand of the Project in addition to the existing and planned future uses within the City of Clovis.

Clovis Community Medical Center (CCMC) is proposing to expand its healthcare facilities on its campus located east of Temperance Avenue between Herndon Avenue and State Route 168. In addition, commercial uses and a hotel are proposed on land owned by CCMC west of Temperance Avenue and commercial uses and an assisted living facility are proposed on land south of Herndon Avenue.

The existing medical center comprises 719,548 square feet of building area, including the main hospital building (223,521 square feet), a bed tower (138,726 square feet), the outpatient care center (70,300 square feet), a conference center (21,814 square feet), a central plant (17,354 square feet), a parking garage (659 spaces), and administrative, corporate, and medical office buildings (247,833 square feet total). The existing medical center includes 208 licensed beds. The proposed expansion is divided into two major phases: a 2-10 year expansion plan and a 20 year expansion plan. The components of the 2-10 year expansion plan are listed in **Table 2-2** and shown in Figure 2.3. Construction of these components will increase the building square footage of the medical center by approximately 410,172 square feet to a total of 1,129,720 square feet. The number of licensed beds will increase from 208 to 358. The 2-10 year expansion plan also includes the addition of up to 150,000 square feet of commercial space west of Temperance Avenue, as well as a 150-room hotel.

## Annual Supplies

The City of Clovis has four primary sources of water:

- *Surface Water from the San Joaquin and Kings rivers, via contract with Fresno Irrigation District (FID).*
- *Supply from Storage, which is water withdrawn from underground storage facilities operated by FID.*
- *Groundwater pumped directly from beneath the City*
- *Recycled Water from the City's Water Reuse Facility*

These sources will cumulatively be adequate to meet all Project demands during normal, dry and multiple dry water years. Each source is evaluated individually in this WSA.

The water supplies available to the Project are summarized in **Table ES-1**, along with the status of the agreement or permit that authorize their use. As shown, water from San Joaquin and Kings rivers, which is available under agreement with Fresno Irrigation District, and Supply from Storage are the primary supplies. Groundwater pumped within the City of Clovis city limits is available up to the sustainable yield of the underlying aquifer, though the City's Draft Water Master Plan Update, Phase III shows that the City intends

to not pump non-banked groundwater after 2016. Recycled water will be used to meet a portion of the Project's landscape water demand.

**Table ES-1. Overall City Water Supplies at Buildout**

| Overall City Water Supplies at Buildout |                    |                       |
|---|--------------------|-----------------------|
| Water Supply                            | Quantity (AFY)     | Type                  |
| Groundwater                             | 9,400 <sup>1</sup> | Potable               |
| Surface Water                           | 34,512             | Potable annual supply |
| Exchanges                               | 1,018              | Potable               |
| Supply from Storage                     | 13,500             | Potable               |

## Operational Procedures

The WSA evaluates the availability of water on an annual basis, as required by California Water Code §10910.

The City relies on the four supplies mentioned above to meet water demands. No single supply is adequate to meet all demands throughout the year. Surface water available through the FID agreement will not be adequate to meet the daily demands of the City together with the Project. This will be addressed by pumping banked water from the City's well field. Recycled water from the City's plant is sourced from wastewater, which is an extremely reliable water source and will allow the City to meet certain non-potable demands without placing a drain on the two other primary supplies. The combination of these three supplies is expected to be adequate to meet overall demand within the City under most circumstances, throughout the 20-year planning horizon; the City does not plan to use groundwater as a supply during normal years but it is available as a supplement in dry years.

---

<sup>1</sup> The safe yield of the aquifer, which is expected to be the pumping limit after 2020.

# 1 Introduction

## 1.1 Purpose and Need for the Water Supply Assessment

This Water Supply Assessment (WSA) evaluates the adequacy of available water supplies for the proposed Clovis Community Medical Center Expansion Project (Project), located in the City of Clovis, Fresno County, California. California Water Code §10912(a) requires preparation of a WSA meeting the requirements of Water Code §10910 et seq for projects within cities and counties that meet one of several water demand triggers, or the equivalent. These triggers include: construction of 500 or more residential units, construction of a shopping center or business establishment having 500,000 square feet of floor space, construction of a commercial office building having more than 250,000 square feet, a proposed hotel or motel having more than 500 rooms, or another project having a water demand equivalent to or greater than the 500-unit development.

The Project's proposed hospital expansion, additional ancillary buildings and new medical office buildings more than meet the 250,000 SF office space trigger and so a WSA is required. The City of Clovis operates the water system to which the Project proposes to connect. This water system meets the standards for a "Public Water System" as set forth in Water Code §10912(c); the City is therefore responsible for preparation of the required WSA in accordance with Water Code §10910(b).

## 1.2 Reliance on a Related Urban Water Management Plan

If the Project falls within the boundaries of a current Urban Water Management Plan (UWMP) prepared by the water purveyor, Water Code §10910(c)(1) requires that the WSA determine whether projected water demand associated with the Project included as part of that duly-adopted UWMP. This Project is within the boundaries of the 2015 Clovis UWMP, which was adopted by the City of Clovis by resolution of the City Council on July 5, 2016. The Project area was included in the calculations prepared for the UWMP. Thus, in accordance with the Water Code, the preparers have relied on information from the UWMP, and from the Draft Water Master Plan Update, Phase III (WMP, Provost & Pritchard, 2017), wherever possible in preparing the various elements of this Assessment.

## 1.3 Document Organization

This WSA is organized as follows:

- *Section 2 describes the Project and its location.*
- *Section 3 provides an overview of the City's primary water supplies.*
- *Section 4 describes the Project's potable and non-potable water demands in addition to those of other existing and planned uses, and how these vary from the numbers used in the UWMP.*
- *Section 5 discusses the adequacy of water supplies during normal years.*
- *Section 6 discusses the adequacy of water supplies during single-dry and multiple-dry years.*
- *Section 7 discusses operational reliability on a daily basis.*
- *Section 8 concludes whether supplies would be adequate during normal, dry-year, and multiple-dry years during a 20-year projection.*
- *Section 9 lists references cited in this WSA.*

## 2 Project Description

### 2.1 Project Location and Setting

The Project evaluated in this WSA is the proposed Clovis Community Medical Center (CCMC) Expansion Project (Project), which is planned as phased development to be fully built out over the next 20 years. The CCMC expansion plan includes construction of new inpatient bed towers, medical office buildings, a general support building, a cancer center, a central plant and a parking garage, as well as expansion of the emergency department, surgical facilities, materials management and the outpatient community center. In addition, the CCMC project includes the potential development of areas adjacent to the main campus, primarily with retail commercial buildings, as well as a hotel and an assisted living center.

The project site comprises approximately 148 acres located on the north and south sides of Herndon Avenue, east and west of North Temperance Avenue. The Enterprise Canal forms the eastern boundary of the project site. A description of the project site location and key locational characteristics is provided in **Table 2-1**.

**Figure 2-1** identifies the location of the project in relation to surrounding Clovis/Fresno region. **Figure 2-2** identifies the boundaries of the project site.

The City Limits currently encompasses 23.3 square miles. The City's Sphere of Influence (SOI) covers 31.6 square miles, while the City's General Plan encompasses approximately 73 square miles. Located at the current eastern edge of the City of Clovis, the area around the Project is developing to urban and residential uses; however, residual rural residential uses and vacant parcels remain in the vicinity. Adjacent land uses include urban residential development and an elementary school to the south, the Enterprise Canal and rural residential to the east, State Route 168, agricultural land and commercial development to the north, and rural residential to the west.

The Project site is designated in the City of Clovis General Plan as Office and Mixed Use/ Business Campus. The project site is a part of a large area planned as a Mixed Use/Business Campus, which extends to the north and west. Residential and Public Facilities are designated land uses to the south and Rural Residential to east (Fresno County designation outside of Clovis City Limit). The entire Project site is included in the 2015 Clovis Urban Water Management Plan.

### 2.2 Project Description

Clovis Community Medical Center is proposing to expand its healthcare facilities on its campus located east of Temperance Avenue between Herndon Avenue and State Route 168. In addition, commercial uses and a hotel are proposed on land owned by CCMC west of Temperance Avenue and commercial uses and an assisted living facility are proposed on land south of Herndon Avenue. See **Figure 2-1**.

The existing medical center comprises 719,548 square feet of building area, including the main hospital building (223,521 square feet), a bed tower (138,726 square feet), the outpatient care center (70,300 square feet), a conference center (21,814 square feet), a central plant (17,354 square feet), a parking garage (659 spaces), and administrative, corporate, and medical office buildings (247,833 square feet total). The existing medical center includes 208 licensed beds.

The proposed expansion is divided into two major phases: a 2-10 year expansion plan and a 20 year expansion plan. The components of the 2-10 year expansion plan are listed in **Table 2-2**. Construction of

these components will increase the building square footage of the medical center by approximately 410,172 square feet to a total of 1,129,720 square feet. The number of licensed beds will increase from 208 to 358. The 2-10 year expansion plan also includes the addition of up to 150,000 square feet of commercial space west of Temperance Avenue, as well as a 150-room hotel.

The Project area is designated as Commercial and Mixed-Use in the City's current land use plan. Based on the UWMP land uses and water demand projections, the UWMP planned for the Project Area to have the water demands shown in **Table 2-1**.

**Table 2-1. Project Area Proportion of UWMP Demand Estimates**

| Project Area Proportion of UWMP Demand Estimates |      |      |      |      |      |
|--|------|------|------|------|------|
|  | 2015 | 2020 | 2025 | 2030 | 2035 |
| Project Area                                     | 135  | 173  | 195  | 220  | 249  |

The applicant's projections of Project water use are summarized in **Table 2-2**. See Appendix A for the applicant's actual water demand projections. These projections use building specific demand calculations where those are known, and the water demand factors used in the UWMP for the balance of the Project area, so the estimates are comparable to the work the City has already done. The UWMP accounts for development on the Project lands, but planned for slightly less intensive water use. The UWMP made its water use projections based on planned land uses, since no specific development plans for the area were known at the time the document was prepared.

**Table 2-2. Existing and Projected Water Use**

| Existing and Projected Water Use |                 |           |            |
|----------------------------------|-----------------|-----------|------------|
|                                  | Water Use (AFY) |           |            |
| Land Use                         | Existing        | 2-10 Year | 10-20 Year |
| Hospital                         | 122             | 181       | 262        |
| MOBs                             | 2               | 11        | 13         |
| On-Site Recycled Water           | 2               | 3         | 2          |
| Mixed Use/ Business              | 0               | 85        | 85         |
| Office                           | 0               | 0         | 32         |
| Total:                           | 126             | 280       | 394        |

There is a nearly 60-percent increase from the UWMP demand assumptions to the applicant's project-specific projections. In fact, the difference the change makes to the overall City water budget is less than one-half of a percent, which is well within the margin of error of the original projections. Accordingly, this WSA does not make any adjustments to the UWMP demand projections.

## 2.3 Water Supply/Treatment Infrastructure

Surface water is diverted from the Friant-Kern Canal via a pipeline to the City's Surface Water Treatment Plant (SWTP) located at Bullard and Leonard Avenues. Built in 2004, the SWTP has a current treatment capacity of 22.5 million gallons per day (mgd). Expansion to 45 mgd is planned for the future.

Water will be delivered to the Project via the City's existing and planned distribution system. The water distribution system is shown in full in the WMP, and in detail on **Figure 2-2**. Other than full construction of the loop of 12-inch water lines around the Project Area, no new distribution infrastructure will be required to serve the Project.

Project wastewater will be collected by the City's existing sewer system and will be conveyed either to the Fresno-Clovis Regional Water Reclamation Facility (RWRF) in southwest Fresno, or to the City's Water Recycling Facility WRF. No new wastewater treatment or disposal facilities will be required as a result of the Project.

## 3 Water Demands

This section summarizes Project water demands over a 20-year planning horizon, assuming full buildout in 2035, together with existing and planned future development within the Project site. Project potable and non-potable water demands have been estimated by the applicant. Demands of existing and anticipated development of the project area were included in the UWMP and in the CWMP, and were based on reviews of onsite land uses. This section compares the applicant's projections with the City's earlier plans.

### 3.1 Project Demands

#### 3.1.1 Regulatory Requirements

Indoor water demands are to be calculated based on the California Green Building Standards Code, commonly referred to as the CALGreen Code, and outdoor potable water demands must comply with California's Model Water Efficient Landscape Ordinance (MWELO) requirements.

The CALGreen Code is set forth in California Code of Regulations (CCR) Title 24, Part 11. Among other issues, it establishes voluntary and mandatory standards pertaining to the planning and design of sustainable site development and water conservation. Under the CALGreen Code, all flush toilets are limited to 1.28 gallons per flush, and urinals to 0.5 gallon per flush. In addition, maximum flow rates for faucets are established as follows: 2.0 gpm at 80 pounds per square inch (psi) for showerheads; 1.5 gpm at 60 psi for residential lavatory faucets; and 1.8 gpm at 60 psi for kitchen faucets.

In response to California's severe ongoing drought, the governor released Executive Order B-29-15 on April 1, 2015, which included revisions to the MWELO to increase water efficiency standards through more efficient irrigation systems, graywater use, onsite storm water capture, and by limiting the portion of landscapes that can be planted in turf. Per this executive order, the Department of Water Resources (DWR) updated the 2009 MWELO, which promotes efficient landscapes in new developments and retrofitted landscapes. The revised ordinance was adopted by the California Water Commission on July 15, 2015, and it took effect on December 1, 2015. Any new commercial or residential landscaping over 500 square feet is subject to the updated ordinance.

The MWELO requires a project applicant to prepare a landscape documentation package and submit it to the local agency for approval. Specific plans and reports that must be provided include a water efficient landscape worksheet, soil management report, landscape design plan, irrigation design plan, and grading design plan. A certificate of completion is also required to confirm that the landscape project has been installed per the approved landscape design package. The MWELO also includes provisions for irrigation scheduling and maintenance, as well as irrigation audits. The use of reclaimed water and graywater systems also are addressed.

The following measures are among the 2015 changes to the MWELO:

- *Landscape water meters are required for residential landscape areas over 5,000 square feet and non-residential areas over 1,000 square feet.*
- *Pressure regulators and master valves are required for all new irrigation systems.*
- *Irrigation systems must be designed so that a precipitation rate of 1.0 inch per hour is not exceeded over any portion of the landscape.*
- *Flow sensors that detect and report high flow conditions due to broken pipes and or popped sprinkler heads are required.*

- *Minimum width of turf that can be irrigated with sprinklers increased from 8 to 10 feet. Areas of turf below this threshold must be irrigated with subsurface drip or other technology that produces no over spray or runoff.*

The ordinance also contains prescriptive requirements that may be used as a compliance option. Compliance with certain items is mandatory if this option is followed; these include incorporating compost at a specified rate, using certain types of plants in residential and non-residential areas, and limiting turf to not exceed 25 percent of the landscape in residential areas (no turf is allowed in non-residential areas). Turf is not allowed on areas that exceed a slope of 1:4 (25 percent), and is prohibited in parkways less than 10 feet wide, unless the parkway is adjacent to a parking strip and used for vehicles to enter and exit. Any turf in parkways must be irrigated by subsurface irrigation or by other technology that creates no overspray or runoff.

### 3.1.2 Potable and Non-Potable Water Demand

A water usage projection for the Project was received from the applicant. It had been calculated based on standard water use factors for the buildings and areas proposed, assuming use of CALGreen-compliant water fixtures. Outdoor water demand was calculated using the methodology described in MWEL. Maximum day demand was determined by applying a peaking factor of 2.0 to the Average Day Demand (ADD). Similarly, a peaking factor of 3.3 was applied to the ADD to determine the peak hour demand. These are the peaking factors from the WMP and are consistent with accepted industry standards. **Table 2-2** summarizes demands of the Project currently, at the end of the 2 to 10-year expansion, and at buildout, which would require an average of 394 AF/year.

Water demands were calculated in 5-year increments, as shown in **Table 3-1**. This table is based upon the growth milestones submitted by the applicant for use in the Project EIR.

**Table 3-1. Water Demands in 5-Year Increments (AFY)**

| Water Demands in 5-Year Increments |                  |                  |                   |                   |                   |
|------------------------------------|------------------|------------------|-------------------|-------------------|-------------------|
|                                    | Year 1<br>(2015) | Year 5<br>(2020) | Year 10<br>(2025) | Year 15<br>(2030) | Year 30<br>(2035) |
| Total Demand                       | 126              | 203              | 280               | 337               | 394               |

## 3.2 Demands of Other Existing and Planned Development

The UWMP reports the existing and planned demands for raw, potable and recycled water within the City over the same 20-year planning horizon. These demands are summarized in UWMP Table 4.4, which is reproduced below.

**Table 4.4 Total Water Demands (Guidebook Table 4.3)**

| Demand Use                 | 2015          | 2020          | 2025          | 2030          | 2035          |
|----------------------------|---------------|---------------|---------------|---------------|---------------|
| Potable and Raw Water      | 21,590        | 36,300        | 39,945        | 43,950        | 48,482        |
| Recycled Water             | 382           | 2,913         | 3,137         | 5,498         | 6,274         |
| <b>Total Water Demands</b> | <b>21,972</b> | <b>39,213</b> | <b>43,082</b> | <b>49,448</b> | <b>54,755</b> |

Comparing the total Project water demand in **Table 3-1** with the total water demand analyzed in the UWMP, the Project makes up a very small portion of the overall water being delivered by the City, with the Project's portion increasing from 0.6 to 0.7 percent of the total water delivered annually over the 20-year planning horizon.

The WMP shows the land use designations for the entire City water service area, which were used to plan demand in undeveloped areas. A portion of that plan, including the Project area, is shown on **Figure 3-1**.

## 4 Overview of Water Supplies

Water Code §10910(c)(2) allows reliance on the City's UWMP to determine overall water supply reliability if the Project's planned water demand was included in the UWMP. While the currently-planned demand is slightly greater than was included in the calculations for the UWMP, the project area itself was included and the overall difference in demand is small in comparison with the overall City demand. This WSA relies in large part on the UWMP, with adjustments to the planned water use numbers to account for the most current Project plans.

§10910(d) requires that a WSA identify any existing water supply entitlements, water rights, or water service contracts relevant to the identified water supply for the proposed project, including any such existing entitlements, rights, or contracts held by the public water system or city or county preparing the WSA. These descriptions appear in detail in Chapter 6 of the UWMP and are summarized below. The City's major water infrastructure facilities are shown on **Figure 4-1**.

### 4.1 Surface Water

The City's surface water supply is provided through an agreement with Fresno Irrigation District (FID), which allows the City to receive a share of FID's Kings River and Friant CVP entitlements. Garfield Water District (GWD) and International Water District (IWD) are located within the City's General Plan boundaries. As the districts' service areas are urbanized, surface supplies available to the two districts will be added to the City's surface water supply. At this time, all surface water available to the City comes from the FID contract. The boundaries of each of the districts are shown on **Figure 4-2**.

Kings River entitlement accrues as a result of Sierra snowmelt so the overall quantity varies greatly from year to year. Clovis receives a proportionate share of FID's entitlement based on its acreage within FID compared with the total area of FID, which is currently 5.9%. FID's Kings River entitlement is not directly proportional to the overall runoff quantity. FID was the first agency to establish a diversionary right on the Kings River, in the late 1800s. When the rights of the 27 Kings River water agencies were quantified and tabulated following construction of Pine Flat Dam in 1953, priority for low water flows was given to those agencies with the oldest (or most senior) rights. As a result, FID gets a larger percentage of the overall flow on days when the river flow is low, making its rights in dry water years more reliable than average, and making their wet-year, high flow rights somewhat lower than they otherwise might be. The entitlement rights for each agency are set forth in the Kings River Water Association's "Blue Book," which specifies the entitlement for each agency on each day of the year, based on the calculated actual river flow on the Kings River at the Piedra gauging station below Pine Flat.

Over time, Clovis has received on average 23,609 AF per year from FID, though this has varied from 6,978 AF in the severe drought of 2015 to over 43,000 AF in the wettest year of record. Because of anticipated growth of the City within the FID service area boundary, the City's share of FID Kings River allocation is expected to increase over time. The UWMP projects that the average delivery to the City will climb from the current 23,609 AF per year to 31,670 AF per year by 2030.

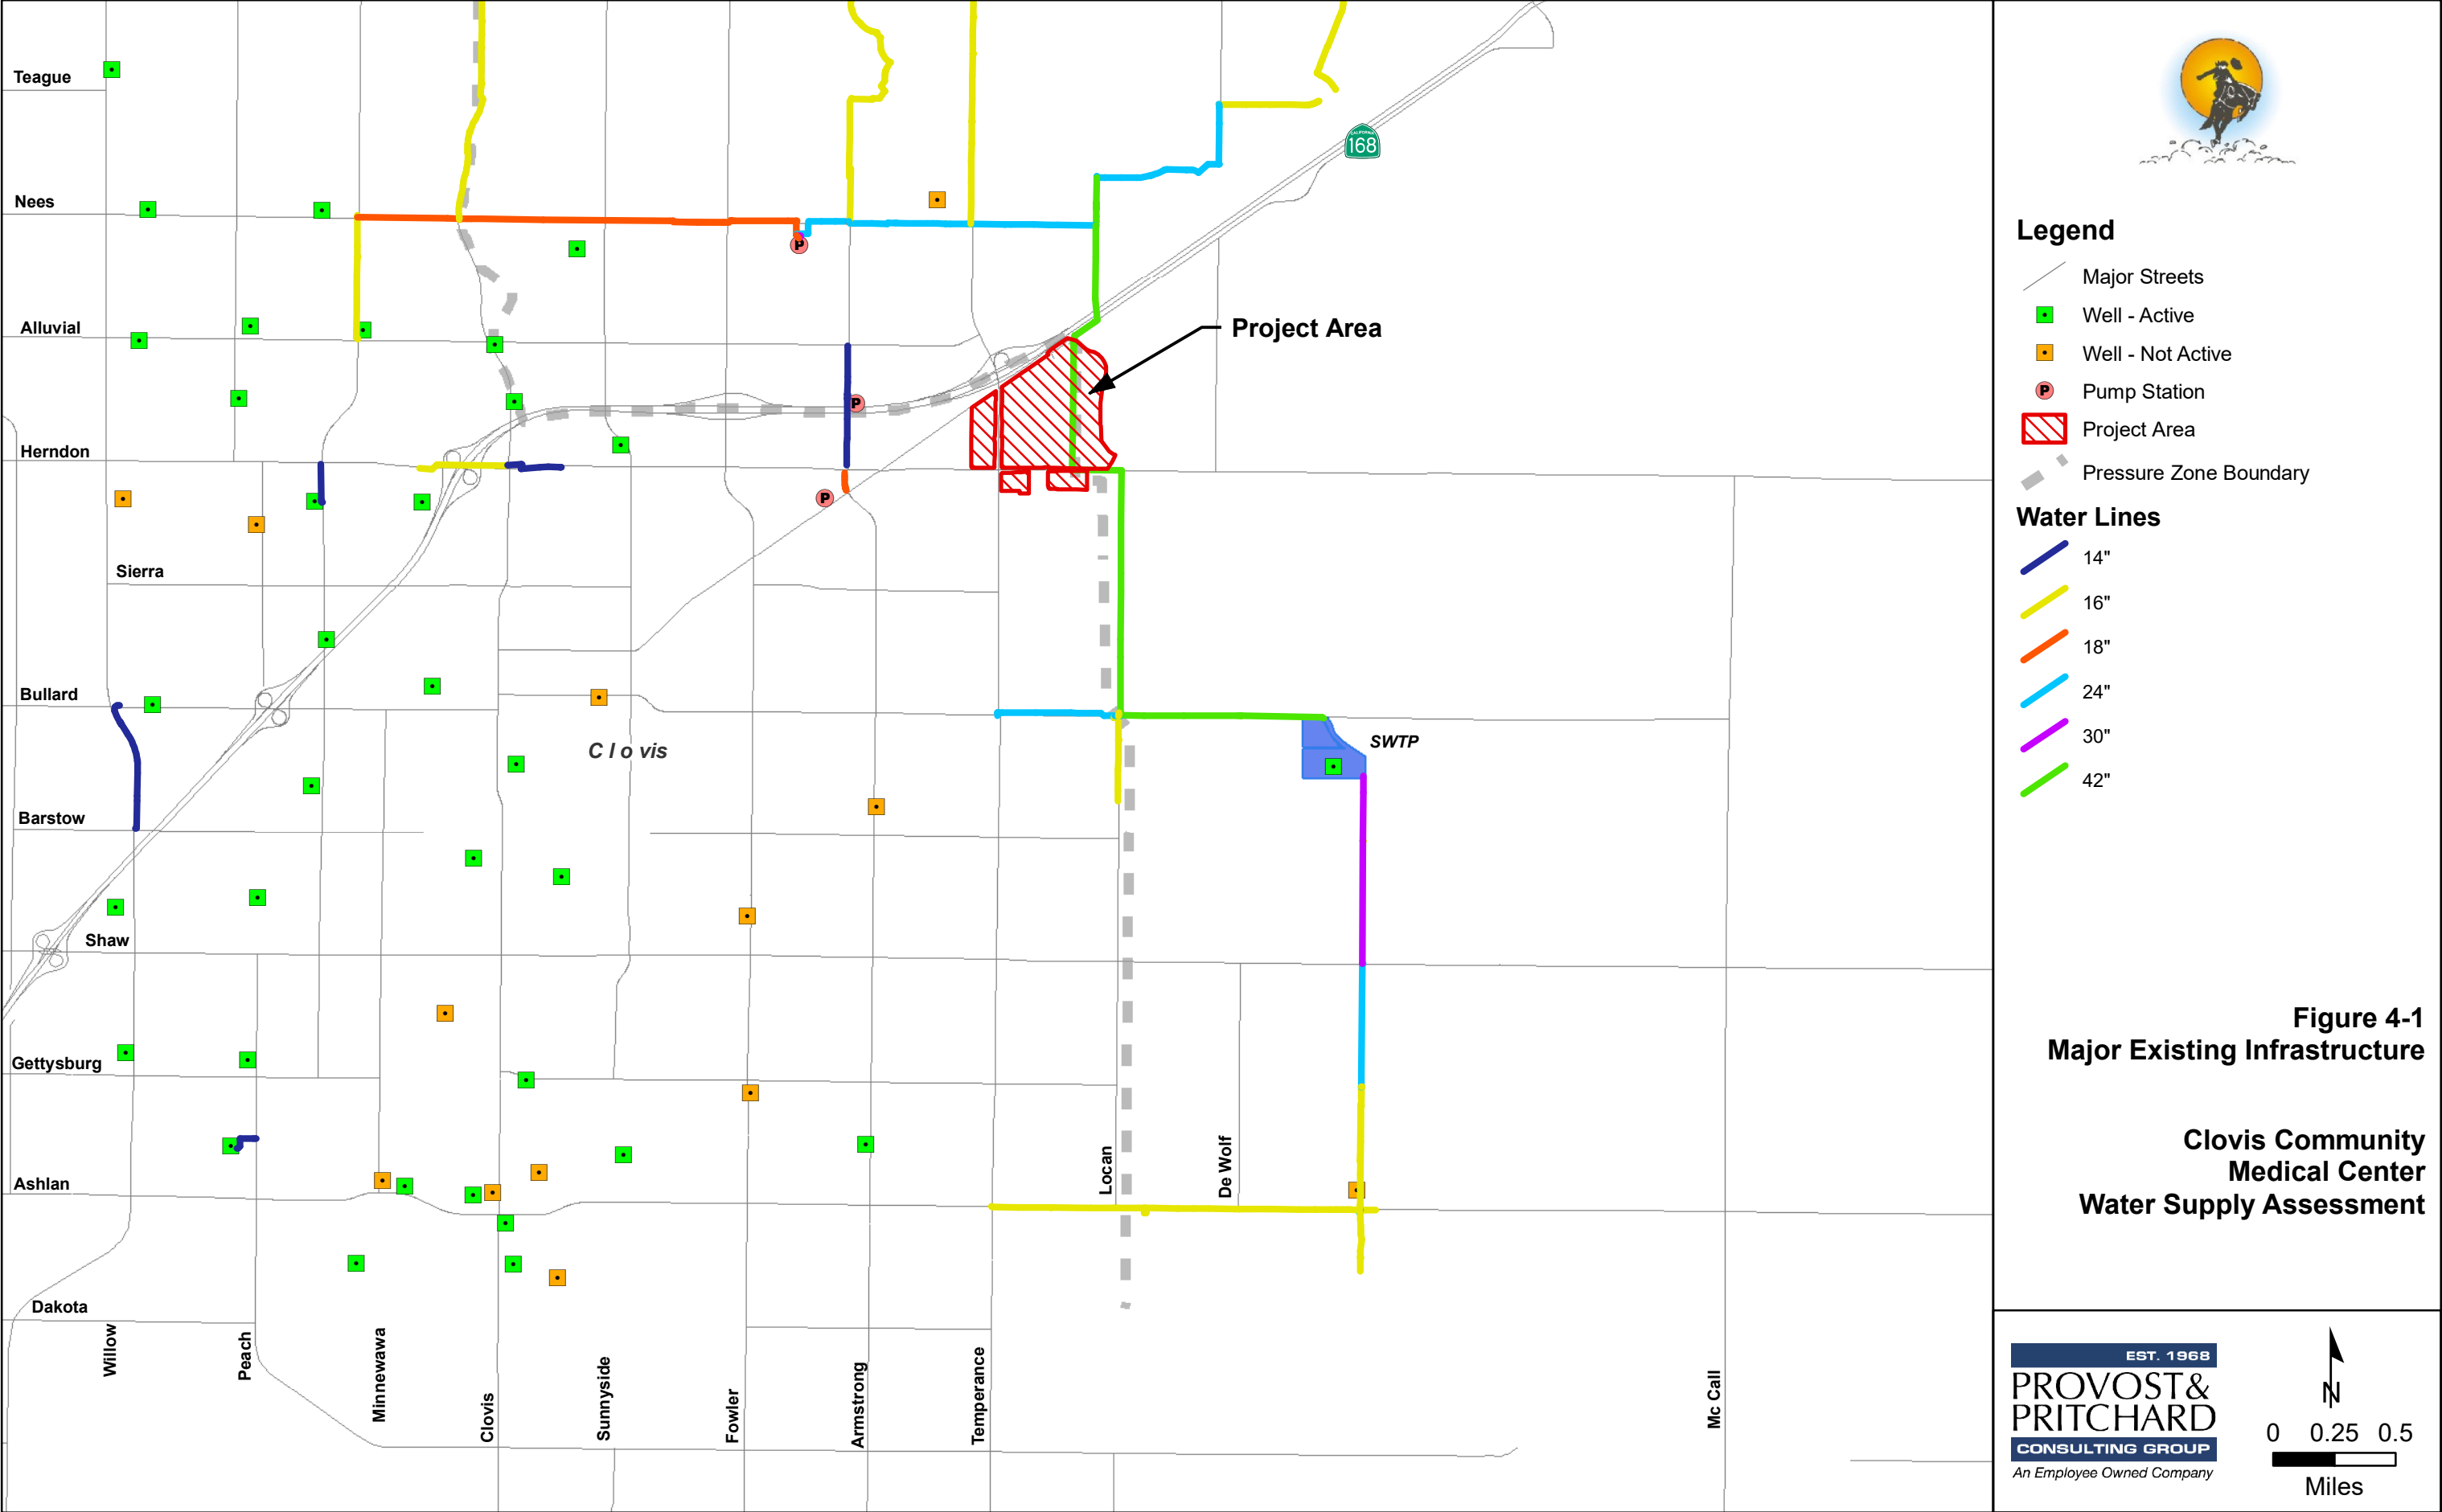

Similarly, Clovis is entitled to a proportion, by area, of FID's Friant CVP Class II entitlement. Class II supplies are driven by the snowmelt in the San Joaquin River basin, but are not directly proportional to runoff. Water behind Friant Dam is managed by the US Bureau of Reclamation (USBR) and falls into several categories or classes. FID's contract is for Class II supplies, which are less dependable than CVP's Class I water contracts. FID contracts with USBR for 75,000 AF of Class II supply, and has received an average of

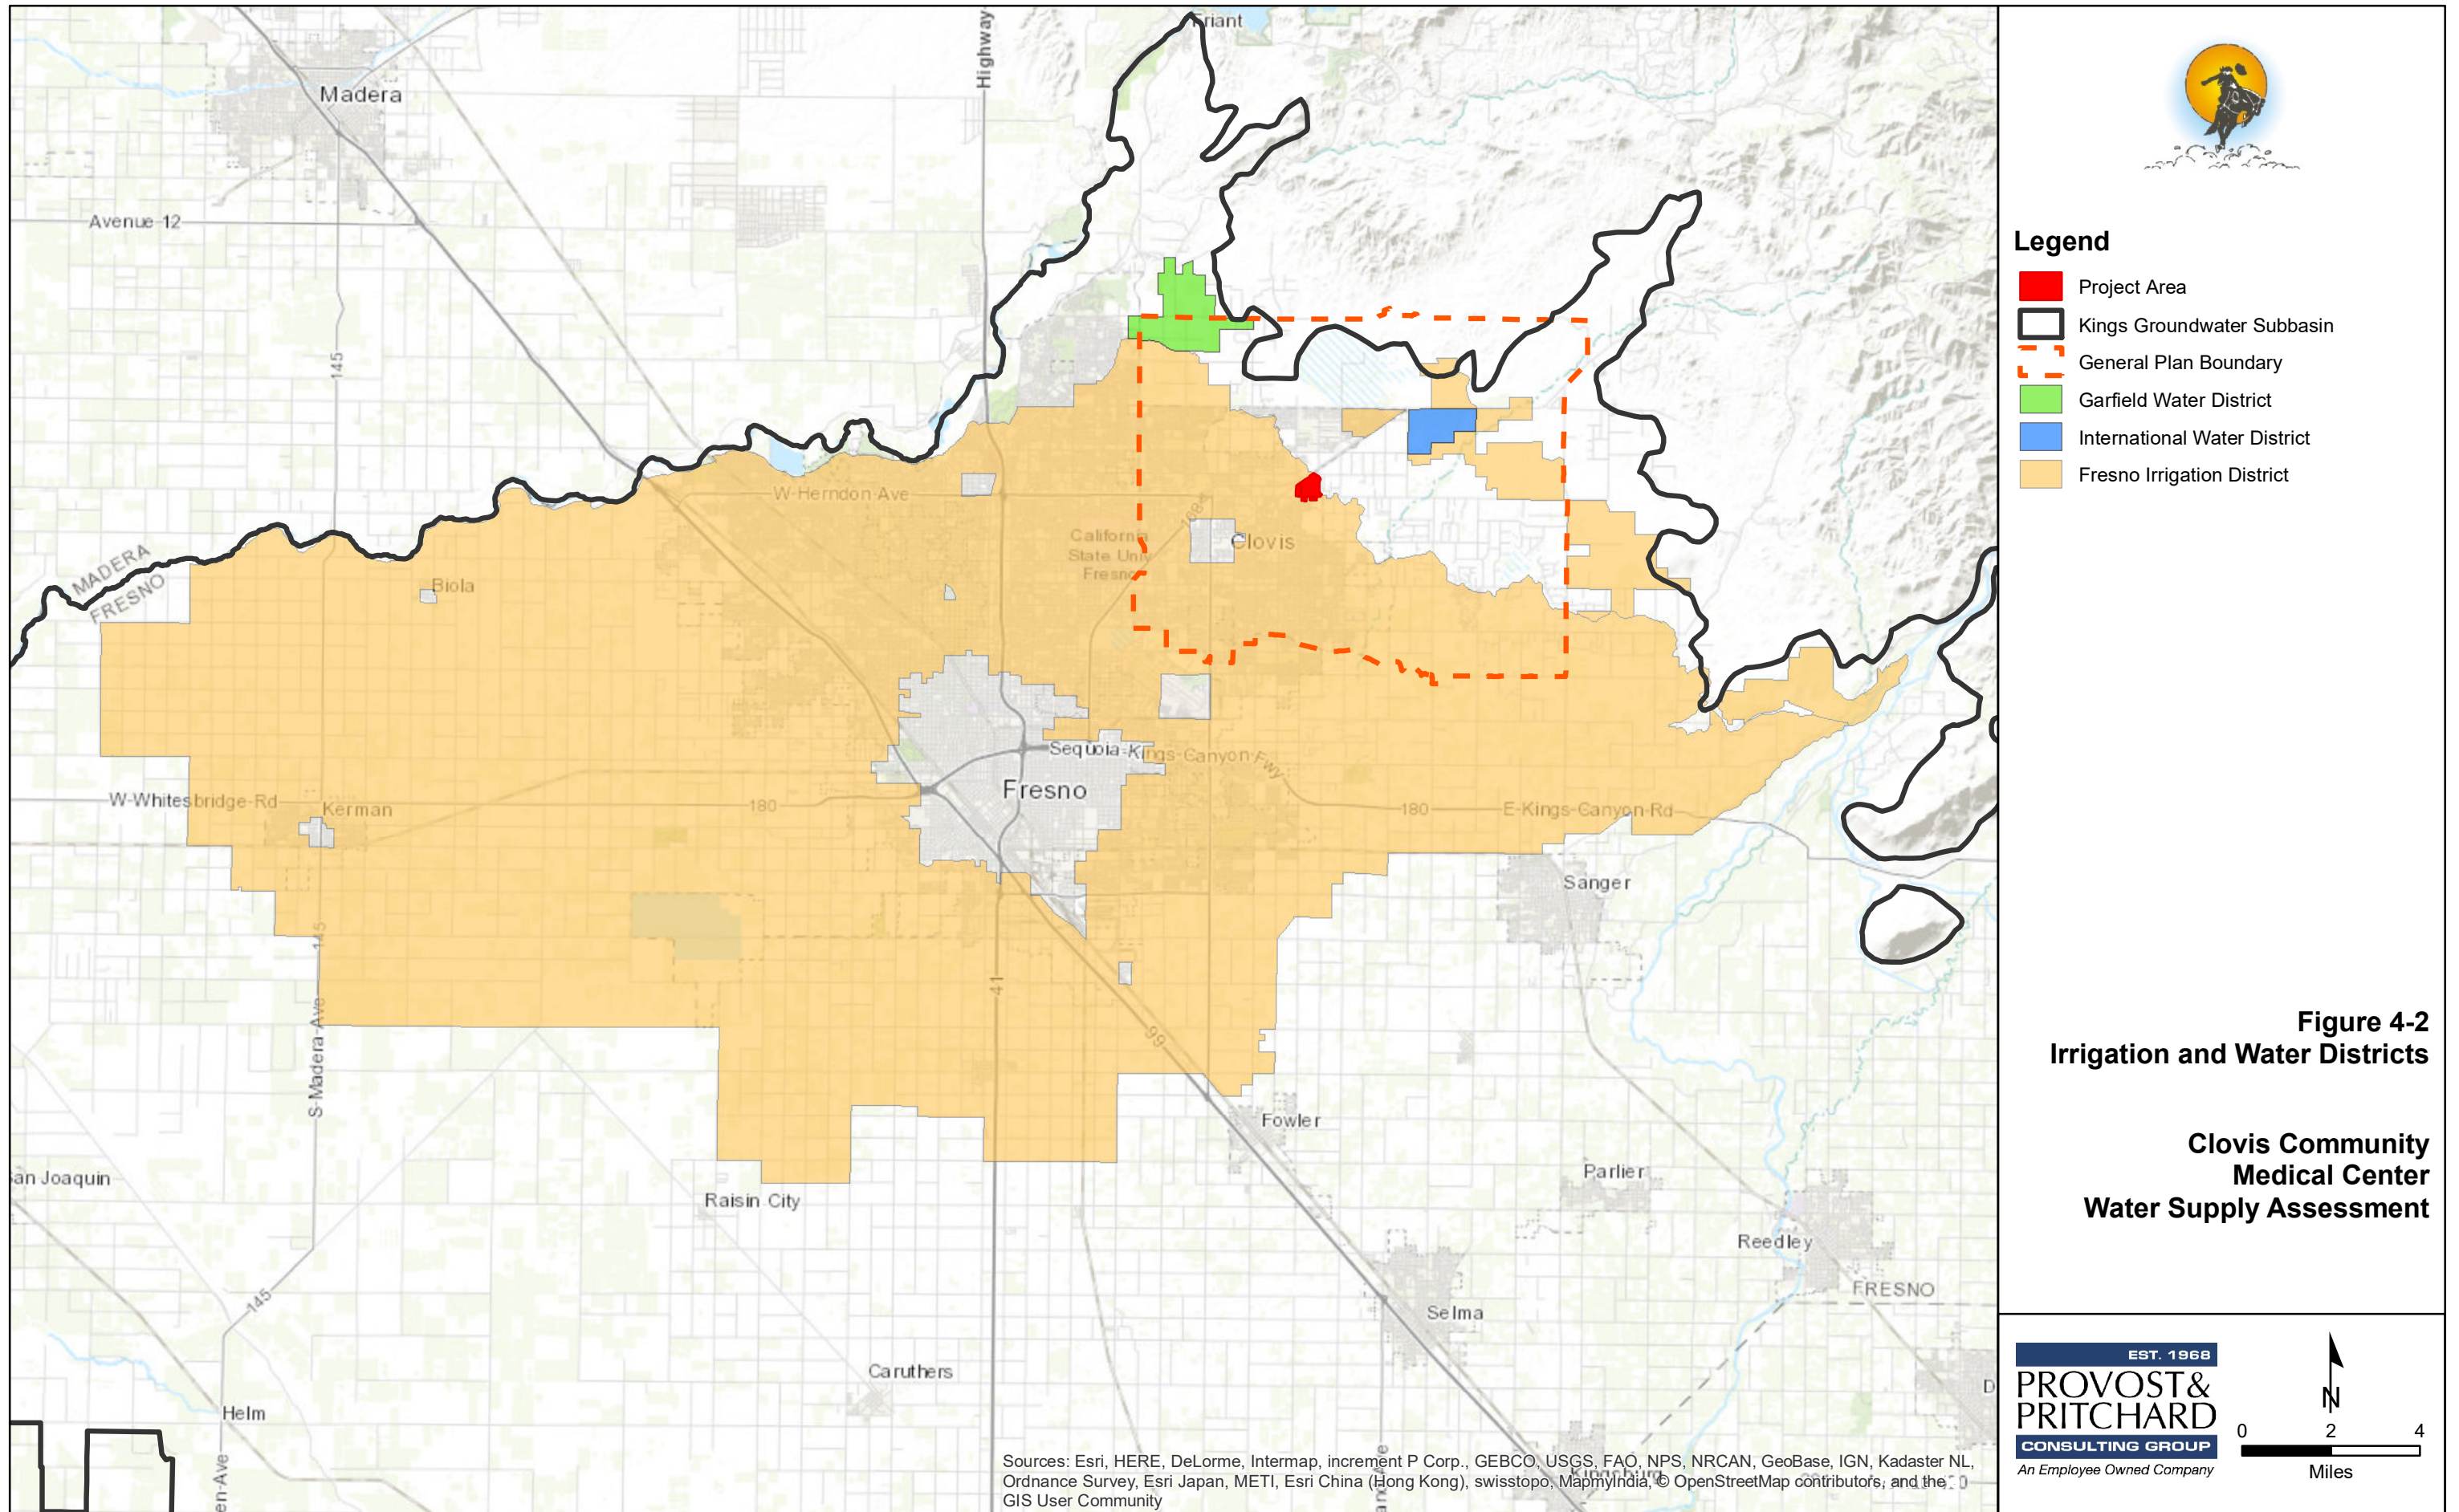

Section Four: Overview of Water Supplies  
Water Supply Assessment  
Clovis Community Medical Center Expansion Project

---

13,577 AF per year, with the actual number ranging from zero to the full 75,000 AF depending upon the nature of each water year over that period. Clovis has received an average of 798 AF per year for its proportionate share.

This Page Intentionally Left Blank

The City's overall water use in 2015 was 21,972 AF (UWMP, Table 4.4). While the average yield from the FID contract could appear to be adequate to meet the demand, two factors require the City to have other available supplies. First, the FID supply contract is not reliable year to year. The combined delivery of San Joaquin and Kings river water per year has ranged from 32 percent of the total demand to over 215 percent of demand. Second, the timing of the surface water deliveries do not meet the City's needs for potable water. Surface water is available from January through September in the wettest years, and may be available for only a 60 to 90-day period in a very dry year. That is not acceptable for a municipal water system with demands every day of the year. The other supplies discussed below are available throughout the year and are used to firm up the surface water supply.

Garfield Water District (GWD) is located north of the City, with a portion of the district in the City's Sphere of Influence (SOI). GWD holds a Class I CVP contract for 3,500 AFY. Friant CVP Class I supplies are relatively reliable, with USBR delivering 100 percent of the contract amount in nearly every water year that is 85 percent of normal or greater. With approximately half of GWD within the City's SOI, an estimated 1,170 AFY is expected to be added to the City's supply as this area develops.

International Water District (IWD) is located east of the City's SOI, within the general plan's boundary. IWD holds a Class I CVP contract for 1,200 AFY, with the same reliability characteristics as discussed above. The City's General Plan designates a portion of the Districts area as industrial and residential use. At build-out of that area, approximately 600 AFY will be added to the City's surface water resources.

## 4.2 Supply from Storage

Since 2004, the City has been storing water in the aquifer in order to create a stable source of supply over the years. Using the City's contracted shares of capacity in FID's Waldron Banking Facility and Boswell Groundwater Banking Facility, the City has been working with FID to recharge surface water, building up credit in the aquifer which allows for annual withdrawals. The surface water banked will include portions of FID's Kings and CVP supplies, as well as potential other surface water supplies that FID is able to secure on the spot market. Recharged water is purchased under separate agreements with FID and is not included in the surface water totals in the previous section, so this is truly a separate and additional water supply. This process is fully explained in the UWMP.

In 2015, 11,222 AF were withdrawn from storage during the worst drought on record. The City has created a recharge plan accounting for historic variations in surface water supplies that will allow it to withdraw an annual 13,500 AF, the maximum withdrawal allowed under the City's agreements with FID. This is considered a firm supply. The 13,500 AF maximum annual withdrawal is built into the water supply projections in the UWMP for each year over the planning horizon.

## 4.3 Groundwater

Until 2004, the City relied totally on pumped groundwater to meet its water demands. With the advent of the SWTP that year and subsequent construction of the banked water facilities and Water Reclamation Plant described in the following sections, the City now intends to rely exclusively on those three supplies and not pump groundwater to meet its normal water demands. The CWMP shows how this will be done, starting in 2017. Despite that operational plan, groundwater from the basin underlying much of the City remains a viable water resource the City will be able to tap if needed, and so is included in this WSA.

The City is located within the Kings Groundwater sub-basin, a part of the Tulare Lake Hydrogeologic Basin as described in the Department of Water Resources Bulletin 118. The groundwater basin is in overdraft and has been for many years. However, it has not been adjudicated.

## Section Four: Overview of Water Supplies

### Water Supply Assessment

#### Clovis Community Medical Center Expansion Project

Tables 6.12 and 6.13 of UWMP provide a great deal of additional information and analysis, and project an annual groundwater budget for the City that varies from 9,964 AF to 13,994 AF depending on the other water resources available at various milestone years. UWMP Tables 6.12 and 6.13 are reproduced below.

Table 6.12 Water Supplies – Actual (Guidebook Table 6.8)

| Water Supply        | Additional Details on Water Supply  | 2015               |                |
|---------------------|-------------------------------------|--------------------|----------------|
|                     |                                     | Actual Volume (AF) | Water Quality  |
| Groundwater         | Tulare Lake Basin 5-22.08           | 12,190             | Raw Water      |

| Groundwater         | Tulare Lake Basin 5-22.08           | 11,153                      | 13,994        | 9,964         | 12,649        |
| Surface Water       | Kings River and CVP                 | 27,314                      | 31,283        | 34,392        | 34,512        |
| Exchanges           | Clovis Share of RWRf exchange water | 1,216                       | 1,281         | 1,001         | 1,018         |
| Supply from Storage | Waldron & Boswell banked Supplies   | 13,500                      | 13,500        | 13,500        | 13,500        |
| Recycled Water      |                                     | 2,913                       | 3,137         | 5,498         | 6,273         |
| <b>Total</b>        |                                     | <b>56,095</b>               | <b>63,194</b> | <b>64,354</b> | <b>67,952</b> |

Chapter 9 of the CWMP calculates a safe groundwater yield for the service area and concludes the safe yield to be 9,400 AF per year for normal, single-dry and multiple-dry years. While final rules have not been set, it is likely that when SGMA regulations go into effect in 2020 groundwater withdrawals will be limited to the safe aquifer yield either annually or on some sort of rolling average basis. **Table 4-1** restates UWMP Table 6.13 with groundwater withdrawals limited to 9,400 AF per year. The totals from **Table 4-1** will be used to complete the analysis in this report.

Table 4-1. Projected Water Supplies (Restated)

| Projected Water Supplies (Restated) |                    |               |               |               |               |
|-------------------------------------|--------------------|---------------|---------------|---------------|---------------|
|                                     | Water Supply (AFY) |               |               |               |               |
| Water Source                        | 2015               | 2020          | 2025          | 2030          | 2035          |

| Recycled Water                      | 1,870              | 2,913         | 3,137         | 5,498         | 6,273         |
| <b>Total:</b>                       | <b>33,139</b>      | <b>54,343</b> | <b>58,601</b> | <b>63,791</b> | <b>64,703</b> |

## 4.4 Recycled Water

The majority of the City's current 6.7 (mgd) wastewater flow is treated at the RWRF, located southwest of the City of Fresno on Jensen Avenue. In 2009, the City of Clovis completed a new WRF. In 2015, the WRF produced an average of just less than 1.9 mg. Of that total, 18 percent was recycled with the remainder being discharged to FID's Fancher Creek for agricultural irrigation.

Ultimately the WRF will be expanded to be able to treat 8.4 mgd, or 9,400 AF per year, and will make a substantial contribution to the City's overall water resources. As of the 2015 UWMP, recycled water is used for irrigation of public and private landscape within the service area. Areas receiving recycled water include the Freeway 168 corridor between Shepherd Avenue and Armstrong Avenue, the existing Clovis Community Medical Center campus, and multiple City parks and landscape areas.

Landscape irrigation will continue to be the main use of recycled water in the future. All public landscape areas within three-quarters of a mile of the distribution system are considered potential recycled water use areas. Clovis Unified School District is evaluating the use of recycled water for its landscape areas. Caltrans has undertaken a project to expand their use of recycled water along Freeway 168 from Armstrong Avenue west to Sierra Avenue. By the year 2020, the use of recycled water is expected to increase in volume and expand its beneficial uses.

In order to effect that increase in use, the City now requires all new development of public landscape near recycled water transmission lines to use recycled water. Additional actions include extending the recycled water distribution system to discharge at groundwater recharge facilities and lowering the cost of recycled water. The UWMP concludes that recycled water use will increase to 6,273 AF per year by 2035<sup>2</sup>.

## 4.5 Exchanges

Water exchanges, transfers, and water banking allow purveyors to manage demand and supply variability by ensuring water will be available for the near future. The majority of the City's wastewater is treated at the RWRF. Under an agreement with FID, the City of Fresno receives approximately one AF of Kings River surface water in exchange for each two AF of reclaimed water produced by the RWRF. Clovis is entitled to receive a percentage of that exchange, in proportion to its prorate share of the RWRF flow, which amounted

<sup>2</sup> UWMP, Table 6.13, page 6-27

to approximately 868 AF in 2015. This water is limited by agreement to being used for groundwater recharge activities.

## 4.6 Water Supply Summary

The five sources discussed above make up all of the City's water resources. These are all tabulated overall for 2015 and for each subsequent 5-year period through 2035 in **Table 4-1** above.

The City's overall water resources are projected to increase from 33,139 AF per year in 2015 to 64,703 AF per year in 2035. Nearly all of this increase will come from increasing surface water resources from 6,989 AF per year in 2015 to 34,512 AF per year in 2035. The mix of water supplies the City plans to use to meet these demands is changing over time, and is illustrated on **Figure 6-2**.

## 5 Normal Year Water Operations

This section evaluates the ability of the City to meet the overall water demands during normal water years during a 20-year projection. A normal year is a year, or averaged range of years, that most closely represents the average water supply available to the City. In this case, the normal year reflects the overall water supply summary discussed in Section 4.

This Chapter relies on information taken from Section 6 of the UWMP and Section 9 of the CWMP, except that groundwater supply is limited to 9,400 AF/year as discussed in Section 4 above. **Table 5-1** repeats **Table 4-1** and shows the supplies available to the City in normal years in 5-year increments.

**Table 5-1. Projected Water Supplies (Restated)**

| Projected Water Supplies (Restated) |                    |               |               |               |               |
|-------------------------------------|--------------------|---------------|---------------|---------------|---------------|
|                                     | Water Supply (AFY) |               |               |               |               |
| Water Source                        | 2015               | 2020          | 2025          | 2030          | 2035          |
| Groundwater                         | 12,190             | 9,400         | 9,400         | 9,400         | 9,400         |
| Surface Water                       | 6,989              | 27,314        | 31,283        | 34,392        | 34,512        |
| Exchanges                           | 868                | 1,216         | 1,281         | 1,001         | 1,018         |
| Supply from Storage                 | 11,222             | 13,500        | 13,500        | 13,500        | 13,500        |
| Recycled Water                      | 1,870              | 2,913         | 3,137         | 5,498         | 6,273         |
| <b>Total:</b>                       | <b>33,139</b>      | <b>54,343</b> | <b>58,601</b> | <b>63,791</b> | <b>64,703</b> |

**Table 5-2** compares the City's potable and non-potable demands in 5-year increments, and compares them with the normal year water supplies. As shown, total supplies would exceed total demands in all years. Potable supplies would exceed potable demands. Non-potable demands would equal or exceed the available quantity of recycled water in all except 2015, where there is an apparent 1-AF shortfall of non-potable water, likely due to a rounding error in the original calculation. It is clear that in 2030 and 2035 (and likely in later years) the City will limit the supply of non-potable (recycled water) to the available supply and any shortfall will be made up by potable water. Adequate supplies are available to serve the City and its water customers in normal rainfall years such as these modeled in this section.

## 6 Single-Dry and Multiple-Dry Year Water Supplies

This section evaluates the availability of City water supplies during single-dry and multiple-dry water years over the 20-year planning horizon, based on Project buildout in 2035. Intermediate year demand projections are made in the same manner as with the normal year analysis. Numerous factors will work to change the relative quantities of water the City receives from its several water sources. Since each of these has a different reliability in dry years, the overall water supply reliability will change over time. The following sections discuss how this will occur.

A single-dry year is the year that represents the lowest water supply available to the Project, and is referred to as a “critical dry” water year in the CWMP. To define the single-dry year, this WSA uses the hydrologic conditions existing during 2015, the driest single year of record in terms of Kings River entitlement, and during 2014 when there was a zero allocation of both Class I and Class II Friant CVP water.

A multiple-dry year period represents the lowest average supply available to the Project for a consecutive three-year period. This analysis is referred to as a “multi-dry” condition in the CWMP. The WSA analysis is based on the three consecutive driest years of record for the Project’s surface water supplies, which were water years 2012/13 through 2014/15.

### 6.1 Water Year Effects on Water Sources

#### 6.1.1 Kings River Surface Water:

Both the single-dry and multiple-dry analyses are most affected by the variations in Kings River entitlement in dry years. Because FID was the first of the 27 Kings River Water Association members to begin river diversions (in the late 19<sup>th</sup> century), FID’s entitlement does not vary directly in proportion to overall annual runoff; rather it favors FID versus all of the other Kings River diverters. When river flows are low due to slow runoff, low annual precipitation or both, FID’s share of the daily river flow increases.

The effect of this is that FID’s entitlement is higher than the overall water year percentage flow, for virtually any below-normal water year. In the driest year on record, the City received 6,978 AF of Kings River Water, against an average (normal year) delivery of 23,609 AF, or 30 percent. Applying this percentage to the City’s larger 2035 share of FID’s Kings River water, which is expected to average 31,670 AF/year, the estimated dry year delivery would be 9,360 AF.

For the multiple-dry years of 2013, 2014, and 2015, FID’s overall Kings River entitlements were 100 percent, 58 percent, and 30 percent of normal entitlement, respectively, or 31,670, 18,369 and 9,360 AF/ year. This represents exceptionally-strong reliability for a runoff-based water supply.

#### 6.1.2 Friant CVP Surface Water:

Over the period of 1986 through 2016, the average Class II allocation has been 38 percent of contracted amount. However, Class II supplies are particularly subject to the water year type. Over the 49-year period

mentioned, Class II allocation was zero in 15 of those years, with one 5-year and one 6-year period with no Class II allocations at all. For the selected multiple-dry year period of 2013 through 2015, no Class II water was allocated at all.

While Class I entitlements don't currently affect the City's FID supplies, they will affect the future-year Garfield Water District and International Water District entitlements. Class I allocations in the three multiple-dry years were 62 percent, 0 percent and 0 percent of the contracted amount, respectively.

### 6.1.3 Supply from Storage

The quantity of water available for withdrawal from the City's storage facilities is not reduced in drier water years. Because of the shortage of surface supplies, withdrawals from storage will have to be maximized in order to meet demands. The contract for the Waldron facility allows annual withdrawals of up to approximately 9,000 AF per year, while the Boswell Facility allows up to 90 percent of the safe yield, expected to be near 3,600 AF per year. According to the City, the combined withdrawal limit from the two facilities is considered to be 13,500 AF/year. In any year where surface water deliveries are substantially limited, the City would want to use these resources to the limit.

A related matter is how contributions are made to supply storage. Whereas in normal years the City is making deposits to both of these facilities, in a drier year those contributions would be reduced or halted since the surface supplies necessary for the deposits would no be available. Since the deposits come from surface water resources not counted in the City's water balance, being acquired under separate FID agreements, the curtailment of deposits doesn't reduce the City's water demand.

### 6.1.4 Groundwater

The City of Clovis operates 34 municipal water well, located throughout the service area. All are connected to the distribution system. Their total production over the period 1984 through 2014 is shown in **Figure 6-1** below, which is taken from the WMP.

Figure 6-1. City Groundwater Production (1984-2014)

According to the UWMP, the City aims to eliminate its direct groundwater consumption whenever possible. All of the City's water demands will be met by a combination of surface water and supplies from storage, in water years when those two resources are sufficient to meet demands. In drier years, when surface water supplies are limited, the City will pump groundwater to make up the shortfall.

Planning to make that objective possible is very important, as Chapter 9 of the WMP states that the sustainable groundwater supply in the City service area is 9,400 AF per year, for normal, dry and multi-dry years. The UWMP shows greater groundwater use than that for every year through 2035, and includes a calculated groundwater overdraft. For the time being, there is no restriction against pumping groundwater above the sustainable aquifer yield and in fact that has been a common way to plan to meet dry-year water shortfalls, however, it is likely that upcoming SGMA regulations (which will be effective by 2020) will limit pumpers to withdrawing not more than the safe yield of the aquifer. It is not clear whether that requirement will have to be met every single year, or whether pumpers will be allowed to meet the sustainable-yield limitation on some sort of a rolling average basis.

This WSA uses 9,400 AF per year as the maximum groundwater pumping amount, as being more conservative than the UWMP values, and in an effort to anticipate the mandatory SGMA pumping limits. Due to the very large size of the aquifer underlying the City, available groundwater is not quickly affected by the type of water year. Anticipating a mix of wet and dry years similar to what has been historically seen, this WSA does not reduce available groundwater in dry or multiple-dry years.

### 6.1.5 Recycled Water

Recycled water production, being tied directly to indoor water use, does not vary significantly with the water year type and is not adjusted from normal for this analysis.

## 6.2 Changes in Water Source Reliability Over the Planning Horizon

In 2015, surface water made up 21 percent of the City's direct water supply, and was the source of the water used to create another 34 percent in the form of Supply from Storage. In 2035, the surface water supply will have risen to 53 percent of the total while the Supply from Storage will have declined to 21 percent. **Figure 6-2** illustrates the City's historical and planned mix of water supplies over time.

This means the City's reliance on surface water supplies, to one degree or another, will have increased from 55 percent to 74 percent of the total. While there is a margin of normal year supply available over planned demand over the entire planning horizon, some provision may have to be made for additional reliable storage to account for the majority of the water being subject to water year variability. See the reliability analysis in Section 6.3 following.

## 6.3 Summary of Single-Dry and Multiple-Dry Year Reliability Over the Planning Horizon

Supply for multiple dry years would be drawn from a combination of Kings River surface water, supply from storage, groundwater, and recycled water. No CVP Class I (San Joaquin river) supplies were available in the dry year, nor in two of the three multiple dry years. No CVP Class II supplies were available in any of the dry years. Project demand was assumed to be constant across all water years.

The supplies that would be available during single-dry and multiple-dry years at buildout are summarized in **Table 6-1**. As shown, adequate supplies would be available to supply the City and along with it the Project under all studied conditions. No additional conservation measures are required, although the Section 8 of the UWMP contains a water shortage contingency plan that could be partially or fully implemented if needed or mandated.

## 6.4 Climate-Based Reliability Factors

This WSA defers to the UWMP for consideration of the overall effects of climate change upon supply reliability. See Section 3.3 of the UWMP.

**Figure 6-2**  
**Mix of Water Supplies Graph**

**Clovis Community  
Medical Center  
Water Supply Assessment**

## 7 Operational Reliability

Clovis' surface water entitlement does not accrue all at once during a given water year. Rather, the Kings River entitlement accrues daily throughout the year based on actual river runoff and the KRWA entitlement schedule. The daily nature of the Kings River supply is especially important early in the water year, which begins October 1. The very low river flows in October and November mean that supply is low and the City must rely on other water supplies during those months. The relatively-large supplies available from storage help mitigate the seasonal nature of the surface water supply, and these are further backed up by groundwater supplies equivalent to almost half the City's total annual demand.

The City has not had any issue with temporary water shortages to date. As demand grows and reliance on less-reliable surface supplies increases, temporary and eventually systemic supply shortages will appear if the City does not acquire additional reliable water supplies.

## 8 Conclusions

As summarized in **Table 8-1**, the City has adequate supplies to meet the needs of all the City's water customers including the Project, in normal water years, over the 20-year planning horizon.

In the buildout year, if demand is as projected, the City will be short of water to meet dry year demands, and would be short in the second and third years of a multiple-dry event. Conservation measures, detailed in the UWMP, have been developed that would mitigate these shortfalls by reducing demand approximately 15 percent. Evidence from the 2013 to 2015 drought suggests that those results are achievable. If projected demands are reduced 15 percent, there would be sufficient supplies to meet the demands in the dry year, and throughout the multi-dry event.

We conclude the City of Clovis has adequate water supplies to meet the needs of the City in normal, dry and multi-dry years.

### **CEQA REQUIREMENTS FOR FINAL EIRS**

This Final Program Environmental Impact Report (Final EIR) for the Clovis Community Medical Center and Herndon Avenue Road Widening Project has been prepared in accordance with the requirements of the California Environmental Quality Act (CEQA) Statute and Guidelines. Specifically, CEQA Guidelines Section 15132 provides that a Final EIR shall consist of:

- (a) The Draft Environmental Impact Report (Draft EIR) or a revision of the Draft;
- (b) Comments and recommendations received on the Draft EIR either verbatim or in summary;
- (c) A list of persons, organizations, and public agencies commenting on the Draft EIR;
- (d) The responses of the Lead Agency to significant environmental points raised in the review and consultation process; and
- (e) Any other information added by the Lead Agency.

### **FINAL EIR ORGANIZATION**

This Final EIR is organized as follows:

- Chapter 1 is this introduction.
- Chapter 2 presents the significant impacts of the project and mitigation measures, along with a brief project description and the project objectives.
- Chapter 3 presents the Mitigation Monitoring and Reporting Program for the project.
- Chapter 4 presents the comments that were received on the Draft EIR and the City of Clovis' responses to the comments.
- Chapter 5 shows the revisions made to the Draft EIR.

# CHAPTER 2

## Significant Impacts and Mitigation Measures

---

### INTRODUCTION

This chapter presents the significant impacts of the project and mitigation measures. A brief project description and the project objectives are also provided.

### PROJECT DESCRIPTION

The project evaluated in this EIR includes two components: the proposed Clovis Community Medical Center (CCMC) Expansion Project, and the proposed widening of Herndon Avenue between Temperance Avenue and DeWolf Avenue.

#### *CCMC Expansion*

The Clovis Community Medical Center Project consists of a 2-10 year expansion plan for additional facilities and improvements and a long-range site development master plan for 20 years in the future.

The project site comprises approximately 148 acres located on the north and south sides of Herndon Avenue, east and west of N. Temperance Avenue. Adjacent land uses include urban residential development and an elementary school to the south, the Enterprise Canal and rural residential to the east, Highway 168, agricultural land and commercial development to the north, and rural residential to the west.

The proposed expansion is divided into two major phases: a 2-10 year expansion plan and a 20 year expansion plan. Construction of these components will increase the building square footage of the medical center by approximately 410,172 square feet to a total of 1,129,720 square feet. The number of licensed beds will increase from 208 to 358. The 2-10 year expansion plan also includes the addition of up to 150,000 square feet of commercial space west of Temperance Avenue, as well as a 150 room hotel.

Implementation of the 20-year plan will result in a net increase of 413,769 square feet of medical center building area, taking into account that two of the existing medical office buildings will be replaced by future construction. The total square footage of the medical center upon implementation of the long-range plan will be approximately 1,543,489 square feet. The number of licensed beds will increase to a total of 508. The 20-year plan also includes up to 70,000 square feet of retail and/or office development and a 100-unit Assisted Living or Memory Care facility south of Herndon Avenue.

The existing medical center was authorized through the approval of a Conditional Use Permit. An amended Conditional Use Permit (CUP) must be processed and approved by the City to authorize the proposed expansion plan.

#### *Herndon Avenue Widening*

The proposed Herndon Avenue widening would extend from Temperance Avenue on the west to the southern leg of DeWolf Avenue on the east, encompassing a distance of one mile. This widening is necessary to implement the Clovis General Plan circulation element, which designates Herndon Avenue as an arterial street, and to accommodate traffic from planned land uses, including the CCMC project.

The project would widen the current five-lane section of Herndon Avenue between Temperance and Coventry Avenues to six lanes and widen the roadway between Coventry and the Enterprise Canal

Bridge from two lanes to a four-lane divided roadway. At the Enterprise Canal Bridge the roadway will have tapered to two lanes and the widening between the bridge and the southern leg of DeWolf Avenue will be minor. The project includes the installation of sidewalks, curb and gutter, street lights, median improvements and striping overlay. Existing overhead utilities on the south side of Herndon Avenue between Temperance and Locan Avenues will be placed underground. East of Locan Avenue, the overhead utilities will be relocated outside the roadway. The project will include traffic signals at Locan Avenue and at DeWolf Avenue.

## **PROJECT OBJECTIVES**

The City of Clovis is the lead agency for Clovis Community Medical Center Expansion and Herndon Avenue Widening Project. The lead agency is the public agency that has the principal responsibility for carrying out or approving a project.

The objectives of Clovis Community Medical Center in proposing the project are to:

- Develop a medical campus capable of meeting the growing health care needs of Clovis and the surrounding area;
- Provide a coordinated long-term expansion plan for the medical campus that provides for the modernization and upgrading of existing facilities in concert with the provision of necessary new facilities;
- Provide an efficient vehicular and pedestrian campus circulation system in conjunction with adequate and well-located parking facilities for patients, visitors and staff;
- Continue to provide a well-designed medical campus that is inviting and remains attractive over time, being harmonious with the existing context of the hospital and keeping with the desired aesthetic character of Clovis;
- Provide medical office buildings at locations that will be conducive to the related functions to be provided at the hospital; and
- Provide for future development on land adjacent to the CCMC campus that is compatible and complimentary to the function of CCMC and consistent with the goals and policies of the Clovis General Plan.

The objectives of the City of Clovis in proposing the Herndon Avenue widening project are to:

- Widen and improve Herndon Avenue as an important component of the City's planned circulation system (Herndon Avenue is designated as an arterial street in the Circulation Element of the Clovis General Plan).
- Provide for a street that can accommodate projected traffic from the CCMC expansion and other planned land uses such that the Level of Service is D or less for the City of Clovis portion of Herndon Avenue and Level of Service C or less within the Fresno County portion of the project.
- Provide traffic signals at Locan Avenue and at both legs of DeWolf Avenue to improve access and safety for rural residential areas to the north and south of Herndon Avenue and improved safety for through traffic on Herndon Avenue.
- Minimize or avoid any encroachment or impact to the Enterprise Canal.

## SIGNIFICANT IMPACTS AND MITIGATION MEASURES

Listed in this section are the significant environmental effects of the proposed project. These include the significant impacts of the project that cannot be avoided (significant unavoidable impacts) and those that are potentially significant and can be avoided or mitigated through the implementation of mitigation measures. Impacts that were determined to be less than significant without mitigation are not listed but are discussed in the chapters of this EIR addressing specific resources and conditions.

The project would have significant impacts in relation to a number of resources and conditions. Implementation of the mitigation measures presented in this EIR would either prevent the impacts or render them insignificant, with three exceptions involving impacts from greenhouse gas emissions and noise. Tables 1.1 and 1.2 summarizes the significant impacts and lists the mitigation measures associated with each. Additions to the text in comparison to the Draft EIR are underlined. Text deletions are shown in ~~strikethrough~~ type.

### Significant Unavoidable Impacts

The following significant environmental impacts cannot be avoided if the proposed project is implemented, even with the implementation of listed mitigation measures.

**Table 1.1**  
**Significant Unavoidable Impacts**

| EIR Section  | Impact/Mitigation Measure/Significance  |
|--|---|
| <b>GH-1</b><br><br><b>Greenhouse Gas Emissions</b> | <p><b>Impact:</b> The project would increase the generation of greenhouse gas emissions.</p> <p><b>Level of Significance without Mitigation:</b> Potentially significant</p> <p><b>Mitigation Measures:</b></p> <p><b><i>GH-1:</i></b> During construction and operation of the project, the following measures shall be implemented to reduce greenhouse gas (GHG) emissions:</p> <ul style="list-style-type: none"> <li>(a) Utilize green building materials (materials which are resource efficient, recycled, and sustainable) available locally if possible.</li> <li>(b) Provide shade tree planting in parking lots to reduce evaporative emissions from parked vehicles. Design should provide 50 percent tree coverage within 10 years of construction using low ROG emitting, low maintenance native drought-resistant trees.</li> <li>(c) Plant drought tolerant native shade trees along southern exposures of buildings to reduce energy used to cool buildings in summer.</li> <li>(d) Incorporate outdoor electrical outlets to encourage the use of electric landscape maintenance equipment.</li> <li>(e) Install high-efficiency heating and cooling systems.</li> <li>(f) Utilize high-efficiency gas or solar water heaters.</li> <li>(g) Utilize built-in energy-efficient appliances (i.e., Energy Star rated).</li> <li>(h) Utilize double- or triple-paned windows.</li> <li>(i) Utilize low energy street lights (i.e., sodium, light-emitting diode [LED]).</li> <li>(j) Utilize energy-efficient interior lighting.</li> <li>(k) Use low-VOC content paints during construction and long-term facility maintenance. To the extent possible construction materials that are prefinished or that do not require the application of architectural coatings should be used.</li> <li>(l) Install low water consumption landscape. Use native plants that do not require watering after they are well established or minimal watering during the summer months and are low ROG emitting.</li> </ul> |

|   |   |
|---|---|
|   | <p>(m) Provide a minimum of one designated parking space for alternatively fueled vehicles.</p> <p>(n) Install energy-saving systems in rooms that reduce energy usage associated with HVAC systems and appliances when rooms are not occupied, except where such systems would pose a safety or health concern.</p> <p>(o) Provide a pedestrian access network that internally links all uses and connects all existing or planned external streets and pedestrian facilities contiguous with the project site.</p> <p>(p) Provide on-site bicycle parking beyond those required by California Green Building Standards Code and related facilities to support long-term use (lockers, or a locked room with standard racks and access limited to bicyclists only).</p> <p>(q) Implement traffic calming improvements as appropriate (e.g., marked crosswalks, count-down signal timers, curb extensions, speed tables, raised crosswalks, median islands, mini-circles, tight corner radii, etc.)</p> <p><b>Level of Significance with Mitigation:</b> Implementation of the above mitigation measures would reduce emissions associated with motor vehicle use, energy use, waste generation, and area sources. In addition, Mitigation Measure AQ-1.2 (see Table 1.2, Below) would require the project proponent to enter into a Developer Mitigation Contract (DMC) with the SJVAPCD, which would reduce operational criteria air pollutants (i.e., ROG, NOX, PM10) through various means, including implementation of additional on-site or off-site mitigation and/or the funding of off-site mitigation. These additional measures have not yet been identified, but would likely have the added benefit of reducing project-generated GHG emissions. However, because the GHG emission reductions to be achieved through implementation of the DMC and other mitigation measures cannot be quantified at this time, increased GHG emissions associated with the proposed project would be considered to have a significant impact. This impact is thus considered significant and unavoidable.</p> |
| <p><b>GH-2</b></p> <p><b>Greenhouse Gas Emissions</b></p> | <p><b>Impact:</b> The project may conflict with an applicable greenhouse gas reduction plan, policy or regulation.</p> <p><b>Level of Significance:</b> Potentially Significant</p> <p><b>Mitigation Measures:</b></p> <p>Implement Mitigation Measure GH-1.</p> <p><b>Level of Significance with Mitigation:</b> The recommended mitigation measures for the project would require the project proponent to enter into a Developer Mitigation Contract (DMC) with SJVAPCD and additionally incorporate a number of design and operational elements to curb and reduce generation of GHG emissions. While a DMC would function to reduce operational air pollutants to a specified level, it does not include a directly mandate a specific level. Consequently, the project could conflict with GHG-reduction planning efforts because the emission reductions to be achieved cannot be quantified at this time, and increased GHG emissions associated with the proposed project would be considered to have a significant impact. This impact is therefore considered significant and unavoidable.</p>   |
| <p><b>NO-2</b></p> <p><b>Noise</b></p>                    | <p><b>Impact:</b> The project would result in an increase in long-term ambient noise levels from traffic sources.</p> <p><b>Level of Significance:</b> Potentially Significant</p> <p><b>Mitigation Measures:</b></p> <p><b>NO-2:</b> Once detailed plans for lane configurations and alignments for the widening of Herndon Avenue are prepared, the City of Clovis shall have an acoustical analysis prepared. The acoustical analysis shall evaluate changes in traffic noise levels that would result from the proposed widening in comparison to the City of Clovis General Plan noise standards. Noise-reduction measures (e.g., sound walls) shall be evaluated and implemented, where feasible, to reduce traffic noise levels to below applicable noise standards.</p> <p><b>Level of Significance with Mitigation:</b> The acoustical analysis would be required to evaluate changes in traffic noise levels in comparison to the City of Clovis General Plan noise standards and noise-reduction measures (e.g., sound walls) will be evaluated and implemented, where feasible. However, in some instances, the use of noise-reduction measures, such as sound walls, may not be feasible due to the need to preserve access to noise sensitive properties. Therefore, the impact is considered significant and unavoidable.</p>  |

### Significant Impacts That Can Be Mitigated

The following significant environmental impacts can be avoided or reduced to a less than significant level with the implementation of the mitigation measures listed with each impact.

**Table 1.2**  
**Significant Impacts and Mitigation Measures**

| EIR Section                               | Impact/Mitigation Measure/Significance  |
|---|---|
| <p><b>AE-1</b><br/><b>Aesthetics</b></p>  | <p><b>Impact:</b> Clearing and construction activity would temporarily degrade the visual quality of the project site.</p> <p><b>Level of Significance without Mitigation:</b> Potentially significant</p> <p><b>Mitigation Measures:</b></p> <p><i>AE-1.1:</i> During the project clearing, grading, and construction phases, a chain-link fence six feet in height shall be maintained around the project sites and a solid fence or wall at least six feet in height shall be maintained around the construction staging area. A chain-link fence draped with heavy plastic is suitable for this purpose.</p> <p><i>AE-1.2:</i> The project contractor shall store construction materials that may be on the site for more than 48 hours within the construction staging area, and the project contractor shall park or store construction equipment within the construction staging area. Construction materials or equipment shall not be stored on public streets, and the project contractor shall remove construction materials and equipment from the site when no further need exists for materials or equipment.</p> <p><i>AE-1.3:</i> The project contractor shall keep properties and streets surrounding the project site free from project-related rubbish and debris by removing any rubbish or debris the day it appears.</p> <p><i>AE-1.4:</i> Any excess excavated material shall be removed from the site immediately following completion of the excavation activity that resulted in the material.</p> <p><i>AE-1.5:</i> The project contractor shall remove any graffiti on the project sites within 48 hours of the time it appears.</p> <p><i>AE-1.6:</i> The project contractor shall place all portable restrooms within the construction staging area.</p> <p><b>Level of Significance with Mitigation:</b> Less than significant</p> |
| <p><b>AE-2</b><br/><b>Aesthetics</b></p>  | <p><b>Issue and Threshold of Significance:</b> The project would increase in illumination and glare due to project lighting, building surfaces and parking areas.</p> <p><b>Level of Significance without Mitigation:</b> Potentially significant</p> <p><b>Mitigation Measures:</b></p> <p><i>AE-2.1:</i> Parking lot lighting shall employ full cut-off type fixtures. A full cut-off type fixture is a luminaire or light fixture that, by design of the housing, does not allow light dispersion or direct glare to shine above a 90-degree horizontal plane from the base of the fixture. Full cut-off type fixtures must be installed in a horizontal position as designed.</p> <p><i>AE-2.2:</i> The design of external signs and lighting shall prevent direct glare on adjoining properties.</p> <p><i>AE-2.3:</i> The design for the buildings east of Medical Center Drive East shall incorporate exterior materials designed to minimize reflective glare from the exterior surfaces.</p> <p><b>Level of Significance with Mitigation:</b> Less than significant</p>  |
| <p><b>AQ-1</b><br/><b>Air Quality</b></p> | <p><b>Impact:</b> The project would increase long-term operational emissions of particulate matter and ozone precursor emissions.</p> <p><b>Level of Significance without Mitigation:</b> Potentially significant</p> <p><b>Mitigation Measures:</b></p> <p><i>AQ-1.1:</i> Operation of the proposed project shall comply with SJVAPCD's ISR rule (Rule 9510). Accordingly, an Air Impact Assessment (AIA) shall be prepared for the proposed Project. The AIA shall be submitted to and approved by the SJVAPCD prior to issuance of construction/grading permits by the City of Clovis. The AIA shall include: an estimate of operational emissions prior to the implementation of mitigation measures; a list of the mitigation measures to be applied to the project; an estimate of emissions for each applicable pollutant for the project, or each phase thereof, following the implementation of mitigation; and a calculation of the applicable off-site fee, if required by Rule 9510. Measures that may be implemented to reduce operational emissions may include, but are not limited to, the following:</p>   |

**Table 1.2**  
**Significant Impacts and Mitigation Measures**

|  |  |
|--|--|
|  | <p>(a) Utilize green building materials (materials which are resource efficient, recycled, and sustainable) available locally if possible.</p> <p>(b) Provide shade tree planting in parking lots to reduce evaporative emissions from parked vehicles. Design should provide 50% tree coverage within 10 years of construction using low ROG emitting, low maintenance native drought-resistant trees.</p> <p>(c) Plant drought tolerant native shade trees along southern exposures of buildings to reduce energy used to cool buildings in summer.</p> <p>(d) Incorporate outdoor electrical outlets to encourage the use of electric landscape maintenance equipment.</p> <p>(e) Install high-efficiency heating and cooling systems.</p> <p>(f) Utilize high-efficiency gas or solar water heaters.</p> <p>(g) Utilize built-in energy-efficient appliances (i.e., Energy Star rated).</p> <p>(h) Utilize double- or triple-paned windows.</p> <p>(i) Utilize low energy street lights (i.e., sodium, light-emitting diode [LED]).</p> <p>(j) Utilize energy-efficient interior lighting.</p> <p>(k) Install low water consumption landscape. Use native plants that do not require watering after they are well established or minimal watering during the summer months and are low ROG emitting.</p> <p>(l) Provide a minimum of one designated parking space for alternatively fueled vehicles.</p> <p>(m) Use low-VOC content paints during construction and long-term facility maintenance. To the extent possible construction materials that are prefinished or that do not require the application of architectural coatings should be used.</p> <p>(n) Install energy-saving systems in rooms that reduce energy usage associated with HVAC systems and appliances when rooms are not occupied, except where such systems would pose a safety or health concern.</p> <p>(o) Provide a pedestrian access network that internally links all uses and connects all existing or planned external streets and pedestrian facilities contiguous with the project site.</p> <p>(p) Provide on-site bicycle parking beyond those required by California Green Building Standards Code and related facilities to support long-term use (lockers, or a locked room with standard racks and access limited to bicyclists only).</p> <p>(q) Implement traffic calming improvements as appropriate (e.g., marked crosswalks, count-down signal timers, curb extensions, speed tables, raised crosswalks, median islands, mini-circles, tight corner radii, etc.)</p> <p><u><b>AQ-1.2: A Developer Mitigation Contract (DMC) Voluntary Emission Reduction Agreement (VERA)</b></u> shall be entered into with the SJVAPCD to reduce operational emissions of ROG and NOX to less than 10 tons/year and emissions of PM10 to below 15 tons/year. Operational emissions of ROG, NOX and PM10 (inclusive of PM2.5) shall be reduced in excess of the reductions required per compliance with SJVAPCD's ISR Rule (Refer to Mitigation Measure AQ-1). Emission reductions may be achieved by use of newer, low-emission equipment, implementation of on-site or off-site mitigation, and/or the funding of off-site mitigation, through participation in the SJVAPCD's off-site mitigation program. <u>The project development plans are long term and conceptual in nature and subject to change in uses and extent otherwise allowed by City zoning that have lesser or equal impacts to those assessed in the EIR. VERA emission estimates shall be based on project-specific modeling assumptions where available (e.g., truck trip generation). Modeling performed shall account for declining emissions during the 10-year mitigation period due to vehicle turnover projected by the latest State approved emission models. VERA emission estimates may be revised to reflect actual development plans proposed for the site at the time each building or phase is finalized. VERA mitigation fee payments for a building or phase may be deferred until no later than 30 days prior to commencing construction activities for the building or phase. The DMC VERA shall be reviewed and approved by the SJVAPCD prior to issuance of construction/grading permits by the City of Clovis. The project proponent/owner shall submit to the City of Clovis Planning Department documentation confirming compliance with entering into the DMC VERA prior to issuance of final discretionary approval (e.g., approval of the grading permit for the first construction project relying on this EIR). Development and implementation of the DMC VERA shall be fully funded by the project</u></p> |

**Significant Impacts and Mitigation Measures**

|   |  |
|---|--|
|   | <p>proponent/owner <u>as development progresses</u>. With approval by SJVAPCD, the <del>DMC</del> <u>VERA</u> may also be used to demonstrate compliance with emission reductions required by SJVAPCD's ISR Rule (Rule 9510).</p> <p><b>Level of Significance with Mitigation:</b> Less than significant</p>   |
| <p><b>AQ-2</b><br/><b>Air Quality</b></p> | <p><b>Impact:</b> Impacts to sensitive receptors may occur due to localized PM concentrations from construction activities and air emissions from stationary sources.</p> <p><b>Level of Significance without Mitigation:</b> Potentially significant</p> <p><b>Mitigation Measures:</b></p> <p><b>AQ-2:</b> Implement Measures to Reduce Localized Pollutant Concentrations</p> <p>(a) Potential health risks associated with permitted stationary sources (e.g., emergency generators) shall be evaluated prior to installation and operation, once more detailed equipment specifications have been identified and in accordance with SJVAPCD's permitting requirements. Emissions control measures and/or operational limitations shall be incorporated, to the extent deemed necessary, to ensure that operational emissions would not exceed applicable SJVAPCD's significance thresholds for cancer risk of 20 in one million or an acute/chronic hazard index of one.</p> <p>(b) The following measures shall be implemented to reduce potential expose of sensitive receptors to localized concentrations of construction-generated PM at nearby sensitive receptors and land uses during project construction:</p> <ol style="list-style-type: none"> <li>On-road diesel vehicles shall comply with Section 2485 of Title 13 of the California Code of Regulations. This regulation limits idling from diesel-fueled commercial motor vehicles with gross vehicular weight ratings of more than 10,000 pounds and licensed for operation on highways. It applies to California and non-California based vehicles. In general, the regulation specifies that drivers of said vehicles: <ul style="list-style-type: none"> <li>Shall not idle the vehicle's primary diesel engine for greater than 5 minutes at any location, except as noted in Subsection (d) of the regulation; and,</li> <li>Shall not operate a diesel-fueled auxiliary power system to power a heater, air conditioner, or any ancillary equipment on that vehicle during sleeping or resting in a sleeper berth for greater than 5.0 minutes at any location when within 1,000 feet of a restricted area, except as noted in Subsection (d) of the regulation.</li> </ul> </li> <li>Off-road diesel equipment shall comply with the 5-minute idling restriction identified in Section 2449(d)(2) of the California Air Resources Board's In-Use Off-road Diesel regulation. The specific requirements and exceptions in the regulations can be reviewed at the following web sites: <a href="http://www.arb.ca.gov/msprog/truck-idling/2485.pdf">www.arb.ca.gov/msprog/truck-idling/2485.pdf</a> and <a href="http://www.arb.ca.gov/regact/2007/ordiesl07/froal.pdf">www.arb.ca.gov/regact/2007/ordiesl07/froal.pdf</a>.</li> <li>Signs shall be posted at the project site construction entrance to remind drivers and operators of the state's five-minute idling limit.</li> <li>To the extent available, replace fossil-fueled equipment with alternatively-fueled (e.g., natural gas) or electrically-driven equivalents.</li> <li>Construction truck trips shall be scheduled, to the extent possible, to occur during non-peak hours.</li> <li>The burning of vegetative material shall be prohibited.</li> <li>The proposed project shall comply with SJVAPCD Regulation VIII for the control of fugitive dust emissions. Regulation VIII can be obtained on the SJVAPCD's website at website URL: <a href="https://www.valleyair.org/rules/1ruleslist.htm">https://www.valleyair.org/rules/1ruleslist.htm</a>. At a minimum, the following measures shall be implemented: <ul style="list-style-type: none"> <li>All disturbed areas, including storage piles, which are not being actively utilized for construction purposes, shall be effectively stabilized of dust emissions using water, chemical stabilizer/suppressant, covered with a tarp or other suitable cover or vegetative ground cover.</li> </ul> </li> </ol> |

**Table 1.2**  
**Significant Impacts and Mitigation Measures**

|  |  |
|--|--|
|  | <ul style="list-style-type: none"> <li>• All on-site unpaved roads and off-site unpaved access roads shall be effectively stabilized of dust emissions using water or chemical stabilizer/suppressant.</li> <li>• All land clearing, grubbing, scraping, excavation, land leveling, grading, and cut &amp; fill activities shall be effectively controlled of fugitive dust emissions utilizing application of water or by presoaking.</li> <li>• When materials are transported off-site, all material shall be covered, or effectively wetted to limit visible dust emissions, and at least six inches of freeboard space from the top of the container shall be maintained.</li> <li>• Trackout shall be immediately removed when it extends 50 or more feet from the site and at the end of each workday. (The use of dry rotary brushes is expressly prohibited except where preceded or accompanied by sufficient wetting to limit the visible dust emissions. Use of blower devices is expressly forbidden.)</li> <li>• Following the addition of materials to, or the removal of materials from, the surface of outdoor storage piles, said piles shall be effectively stabilized of fugitive dust emissions utilizing sufficient water or chemical stabilizer/suppressant.</li> <li>• On-road vehicle speeds on unpaved surfaces of the project site shall be limited to 15 mph.</li> <li>• Sandbags or other erosion control measures shall be installed sufficient to prevent silt runoff to public roadways from sites with a slope greater than one percent.</li> <li>• Excavation and grading activities shall be suspended when winds exceed sustained speeds of 20 miles per hour (Regardless of wind speed, an owner/operator must comply with Regulation VIII's 20 percent opacity limitation).</li> </ul> <p>8. The above measures for the control of construction-generated emissions shall be included on site grading and construction plans.</p> <p><b>Level of Significance with Mitigation:</b> Less than significant</p> |
| <p><b>AQ-3</b><br/><b>Air Quality</b></p>          | <p><b>Impact:</b> The project may be inconsistent with the applicable air quality plan.</p> <p><b>Level of Significance without Mitigation:</b> Potentially significant</p> <p><b>Mitigation Measures:</b><br/>Implement Measures AQ-1.1 through AQ-2.</p> <p><b>Level of Significance with Mitigation:</b> Less than significant</p>  |
| <p><b>BR-1</b><br/><b>Biological Resources</b></p> | <p><b>Impact:</b> The project would potentially impact Special Status Species including Vernal Pool Fairy Shrimp (VPFS), Burrowing Owl, Swainson's Hawk and other bird species.</p> <p><b>Level of Significance without Mitigation:</b> Potentially significant</p> <p><b>Mitigation Measures:</b><br/><b>BR-1.1:</b> The City of Clovis shall either:<br/><br/>(a) Conduct surveys for VPFS following USFWS survey guidelines (2015) to determine presence of the species within the project area [A complete survey includes at least one wet season survey and one dry season survey, completed within a 3-year period. If VPFS are not detected, and if approved by USFWS, the City may be exempt from further mitigation measures for VPFS. If VPFS are detected in the roadside depression, an Incidental Take Permit would be required, as detailed in VPFS-1]; or<br/><br/>(b) Elect to skip the surveys and immediately begin the consultation process for an Incidental Take Permit with USFWS and US Army Corps of Engineers (ACOE). A Biological Assessment to review the proposed action (the project) and its effects on the VPFS, in accordance with the legal requirements set forth in Section 7 of the Federal Endangered Species Act, would be required.</p> <p><b>BR-1.2:</b> An Incidental Take Permit for VPFS and shall be obtained from the USFWS prior to construction. All conditions of the permit required by USFWS shall be implemented. Appropriate mitigation credit ratios</p>   |

**Table 1.2**  
**Significant Impacts and Mitigation Measures**

|  |  |
|--|--|
|  | <p>and other measures should be determined in consultation with USFWS and ACOE. At a minimum, the following conservation measures shall be implemented to minimize impacts to the federally listed VPFS and/or other non-listed vernal pool branchiopods including midvalley fairy shrimp and California linderiella:</p> <p>(a) Effects of permanent losses and degradation of VPFS habitat shall be minimized and, to the greatest extent practicable, habitat restored. Before discharge of fill material, creation and/or preservation credits (amount TBD with consultation with USFWS) will be obtained from a USFWS-approved mitigation bank for every acre of habitat directly or indirectly impacted.</p> <p>(b) Staging areas shall be located away from the seasonal wetlands and channels.</p> <p>(c) Temporary stockpiling of excavated or imported material shall occur only in approved construction staging areas. Excess excavated soil shall be used onsite or disposed of at a regional landfill or other appropriate facility.</p> <p>(d) A USFWS-approved biologist conduct habitat sensitivity training related to VPFS for all project contractors and personnel.</p> <p><b>BR-1.3: Avoidance.</b></p> <p>If feasible, any vegetation removal will take place between September 1 and February 1 to avoid impacts to nesting birds in compliance with the Migratory Bird Treaty Act. If vegetation removal must occur during the nesting season, project construction may be delayed due to actively nesting birds and their required protective buffers.</p> <p><b>BR-1.4: Pre-Construction Surveys.</b></p> <p>(a) If vegetation removal or ground disturbance will commence between February 1 and August 31, a qualified biologist will conduct a pre-construction survey for nesting birds within 14 days of the initiation of disturbance activities. This survey will cover:</p> <p>(1) Potential nest sites in trees, bushes, or grass within species-specific buffers of the project area (Swainson's hawk – 0.5 mile, other raptor species such as white-tailed kite – 500 ft, non-raptor species (loggerhead shrike, magpie etc. – 250 ft).</p> <p>(2) Survey protocol developed by the Swainson's Hawk Technical Advisory Committee (TAC) should be followed (CDFG 2000), which includes survey timing and requirements for repeated visits.</p> <p>(b) Surveys for burrowing owl will occur within 14 days prior to any ground disturbance, no matter the season. This survey will cover potential burrowing owl burrows in the project area and suitable habitat within 150 m (500 ft). Evaluation of use by owls shall be in accordance with California Department of Fish and Wildlife survey guidelines (CBOC 1993, CDFG 1995, CDFG 2012). Surveys will document if burrowing owls are nesting or using habitat in or directly adjacent to the project area. Survey results will be valid only for the season (breeding (Feb 1-Aug 31) or non-breeding (Sept 1-Jan 31) during which the survey is conducted.</p> <p>(c) If no active nests or burrows are detected during the pre-construction survey, then no further action is required. If an active nest or burrow is detected, then the minimization measures described in MM BR-5 shall be implemented.</p> <p><b>BR-1.5: Minimization/Establish Buffers.</b></p> <p>(a) Swainson's hawk, white-tailed kite, loggerhead shrike, yellow-billed magpie, Nuttall's woodpecker, oak titmouse, and MBTA-protected species:</p> <p>If any active nests are discovered (and if construction will occur during bird breeding season), the USFWS and/or CDFW will be contacted to determine protective measures required to avoid take. These measures could include fencing off an area where a nest occurs, or shifting construction work temporally or spatially away from the nesting birds. Biologists are required on site to monitor construction while protected migratory birds are nesting in the project area. If an active nest is found after the completion of the pre-construction surveys and after construction begins, all construction activities will stop until a qualified biologist has evaluated the nest and erected the appropriate buffer around the nest.</p> <p>(b) Burrowing owl:</p> |
|--|--|

**Table 1.2**  
**Significant Impacts and Mitigation Measures**

|  |  |
|--|--|
|  | <p>If burrowing owls are detected within the survey area, CDFW should be consulted to determine the suitable buffer. These buffers will take into account the level of disturbance of the project activity, existing disturbance of the site (vehicle traffic, humans, pets, etc.), and time of year (nesting vs. wintering). If avoidance is not feasible, the City will work with CDFW to determine appropriate mitigation, such as passive exclusion or translocation, and associated mitigation land offset (CDFG 2012).</p> <p>If avoidance is not feasible, as per the General Plan Update PEIR (City of Clovis 2014), “A qualified biologist will develop appropriate mitigations that will reduce project impacts to sensitive or protected biological resources to a less than significant level. The type and amount of mitigation will depend on the resources impacted, the extent of the impacts, and the quality of habitats to be impacted. Mitigations may include, but are not limited to: 1) Compensation for lost habitat or waters in the form of preservation or creation of in-kind habitat or waters, either onsite or offsite, protected by conservation easement; 2) Purchase of appropriate credits from an approved mitigation bank servicing the Clovis General Plan Update Area; 3) Payment of in-lieu fees.”</p> <p><b>Level of Significance with Mitigation:</b> Less than significant</p>  |
| <p><b>BR-2</b><br/><b>Biological Resources</b></p> | <p><b>Impact:</b> The widening of Herndon Avenue would impact 0.204 acres of wetlands.</p> <p><b>Level of Significance without Mitigation:</b> Potentially significant</p> <p><b>Mitigation Measures:</b></p> <p><b>BR-2.1:</b> The City of Clovis shall obtain a Section 404 CWA Nationwide Permit (#14 for linear transportation projects) from the ACOE for impacts to wetlands and waters of the United States and comply with the mitigation measures identified in the permit to prevent discharge of pollutants to surface waters during construction. This shall include complying with the State’s National Pollution Discharge Elimination System (NPDES) General Permit for Discharges of Storm Water Runoff Associated with Construction Activity (General Permit) issued by the Central Valley Regional Water Quality Control Board (CVRWQCB). A Section 401 Water Quality Certification must be obtained from the RWQCB for all proposed impacts to Waters of the State. A Section 1602 Lake and Streambed Alteration Agreement, if required by CDFW, must be obtained prior to the placement of any fill within the seasonal swale in the Project Area. Though the Nationwide Permit process, the ACOE will also submit a Biological Assessment to USFWS to initiate formal consultation under Section 7 of FESA to determine if the action could result in the incidental take of a federal listed species (in this case VPFS).</p> <p><b>BR-2.2:</b> To mitigate for impacts to waters and/or wetlands, at least one of the following measures shall be incorporated:</p> <p>(a) credits will be purchased from an approved mitigation bank (typically at a 2:1 or 3:1 ratio; to be determined in consultation with ACOE and USFWS); or</p> <p>(b) a creation, restoration, or preservation project will be identified in the vicinity; or</p> <p>(c) mitigation performed as otherwise directed by regulatory agencies during permit preparation.</p> <p>Mitigation will be implemented prior to or concurrent with filling jurisdictional waters and/or wetlands. Since the waters to be impacted by the road widening overlap with potential VPFS habitat, VPFS mitigation may incorporate a portion of the required wetland/waters mitigation acreage.</p> <p><b>Level of Significance with Mitigation:</b> Less than significant</p> |
| <p><b>BR-3</b><br/><b>Biological Resources</b></p> | <p><b>Impact:</b> The widening of Herndon Avenue would impact a small wetland swale riparian habitat.</p> <p><b>Level of Significance without Mitigation:</b> Potentially significant</p> <p><b>Mitigation Measures:</b></p> <p>Implement Mitigation Measures BR-2.1 and BR-2.2.</p> <p><b>Level of Significance with Mitigation:</b> Less than significant</p>  |
| <p><b>CR-1</b><br/><b>Cultural Resources</b></p>   | <p><b>Impact:</b> Potential disturbance of subsurface cultural and/or paleontological resources may result from project construction activities.</p> <p><b>Level of Significance without Mitigation:</b> Potentially significant</p>   |

**Table 1.2**  
**Significant Impacts and Mitigation Measures**

|                       |  |
|-----------------------|--|
|                       | <p><b>Mitigation Measures:</b></p> <p><b>CR-1.1:</b> All contractors and subcontractors for the project shall be informed, in writing, of the possibility that cultural or paleontological resources may be discovered during project activities. If any cultural or paleontological materials are uncovered during project activities, work in the area or any area reasonably suspected to overlie adjacent remains shall halt until a professional evaluation and/or data recovery excavation can be planned and implemented. Appropriate measures to protect remains from accidents, looting, and vandalism shall be implemented immediately.</p> <p><b>CR-1.2:</b> After they have been professionally recorded in their place of discovery, archaeological or paleontological materials shall be transferred to an appropriate regional repository for preservation, research, and/or use in interpretive exhibits.</p> <p><b>CR-1.3:</b> If human remains are discovered, the Fresno County Coroner must be notified immediately. The Coroner has two working days to examine the remains and 24 hours to notify the Native American Heritage Commission (NAHC) if the remains are Native American (Health and Safety Code Section 7050.5). Once the NAHC is notified, the procedures set forth in CEQA Guidelines Section 15064.5(d) and Public Resources Code Section 5097.98 shall be followed.</p> <p><b>Level of Significance with Mitigation:</b> Less than significant</p>   |
| <b>NO-1<br/>Noise</b> | <p><b>Impact:</b> Temporary or periodic increases in ambient noise levels would result from construction activities.</p> <p><b>Level of Significance without Mitigation:</b> Potentially significant</p> <p><b>Mitigation Measures:</b></p> <p><b>NO-1:</b> The following measures shall be implemented to reduce construction-generated noise levels:</p> <p>(a) Construction activities (excluding activities that would result in a safety concern to the public or construction workers) shall be limited to between the hours of 7:00 a.m. and 7:00 p.m.</p> <p>(b) Construction equipment shall be properly maintained and equipped exhaust mufflers and engine shrouds in accordance with manufacturers' recommendations.</p> <p>(c) Construction equipment staging areas shall be located at the furthest distance possible from nearby noise-sensitive land uses.</p> <p><b>Level of Significance with Mitigation:</b> Less than significant</p>  |
| <b>NO-3<br/>Noise</b> | <p><b>Impact:</b> An increase in long-term ambient noise levels from operational features would result from the project.</p> <p><b>Level of Significance without Mitigation:</b> Potentially significant</p> <p><b>Mitigation Measures:</b></p> <p><b>NO-3:</b> The following measures shall be implemented to reduce operational noise levels:</p> <p>(a) An acoustical analysis shall be prepared for the proposed central plant prior to final design. The acoustical analysis shall identify building/equipment noise-reduction measures to be incorporated sufficient to achieve an exterior average-hourly noise-level of 50 dBA Leq, or less, at the property line of the nearest noise-sensitive land use. This average-hourly noise levels performance standard would equate to an average-daily noise level of approximately 58 dBA CNEL, which would ensure compliance with the City of Clovis exterior and interior noise level standards of 65 and 45 dBA CNEL, respectively. Noise-reduction measures to be incorporated may include, but are not limited to, the selection of alternative or quieter equipment, use of sound enclosures, and shielding building intake and exhaust vents from direct line of sight of nearby noise-sensitive land uses. The acoustical analysis shall be submitted to the City of Clovis Planning Department for review and approval prior to issuance of construction/grading permits for the construction of the central plant.</p> <p>(b) Emergency generators shall be enclosed and fitted with exhaust silencers.</p> <p>(c) Building air conditioning units for proposed structures shall be located on building rooftops and shielded from direct line-of-sight of adjacent noise-sensitive land uses. Building parapets shall be constructed, when necessary, to shield nearby land uses from direct line-of-sight of air conditioning units.</p> |

## **AREAS OF CONTROVERSY**

CEQA Guidelines Section 15123 requires that the EIR identify any “areas of controversy known to the Lead Agency including issues raised by agencies and the public.”

Based on comments provided in response to the Notice of Availability published for the DEIR, the items listed below have been identified as potential areas of controversy. Each of these items is addressed in Chapter 4 of the Final EIR (see reference in parenthesis):

- Concerns from a neighboring property owner regarding noise and aesthetic impacts from development at the east side of the CCMC project area. (See Comment Letter 1 and Response in Chapter 4)
- Concerns from a neighboring property owner regarding air quality, noise, and traffic conditions resulting from the proposed Herndon Avenue widening. (See Comment Letter 3 and Response Chapter 4)
- Concerns from a neighboring propane gas business regarding compatibility of proposed development at the west side of the CCMC project area with nearby propane gas facilities. (See Comment Letter 6 and Response in Chapter 4)

The lead agency is not aware of any other areas of controversy.

# CHAPTER 3

## Mitigation Monitoring and Reporting Program

---

This Mitigation Monitoring and Reporting Program (MMRP) has been prepared in accordance with State CEQA Guidelines Section 15091(d) and Section 15097. The purpose for the Mitigation Monitoring and Reporting Program is to ensure that the mitigation measures identified in this Final EIR are implemented.

The MMRP table to follow lists the mitigation measures that will be implemented as part of the project. These measures correspond to those listed in the Summary section of this Final EIR. To ensure that the mitigation measures are properly implemented, the table identifies the timing and responsibility for monitoring and reporting the implementation of the measures. CCMC and the City will have the responsibility for implementing the measures applicable to the CCMC expansion and Herndon Avenue widening, respectively, and various City of Clovis departments/divisions and other agencies will have the primary responsibility for monitoring and reporting the implementation of the mitigation measures.

**Mitigation Monitoring and Reporting Program for the  
Clovis Community Medical Center Expansion and Herndon Avenue Widening Project**

**AESTHETICS**

| <b>IMPACT</b>  | <b>MITIGATION MEASURES</b>   | <b>TIMING</b>   | <b>MONITORING AGENCY</b>  | <b>SIGN OFF</b> |
|--|--|---|---|-----------------|
| AE-1: Clearing and construction activity would temporarily degrade the visual quality of the project site.               | <p><b>AE-1.1:</b> During the project clearing, grading, and construction phases, a chain-link fence six feet in height shall be maintained around the project sites and a solid fence or wall at least six feet in height shall be maintained around the construction staging area. A chain-link fence draped with heavy plastic is suitable for this purpose.</p> <p><b>AE-1.2:</b> The project contractor shall store construction materials that may be on the site for more than 48 hours within the construction staging area, and the project contractor shall park or store construction equipment within the construction staging area. Construction materials or equipment shall not be stored on public streets, and the project contractor shall remove construction materials and equipment from the site when no further need exists for materials or equipment.</p> <p><b>AE-1.3:</b> The project contractor shall keep properties and streets surrounding the project site free from project-related rubbish and debris by removing any rubbish or debris the day it appears.</p> <p><b>AE-1.4:</b> Any excess excavated material shall be removed from the site immediately following completion of the excavation activity that resulted in the material.</p> <p><b>AE-1.5:</b> The project contractor shall remove any graffiti on the project sites within 48 hours of the time it appears.</p> <p><b>AE-1.6:</b> The project contractor shall place all portable restrooms within the construction staging area.</p> | Ongoing during grading and construction.  | City of Clovis Planning and Development Services Department – Building Division |                 |
| AE-2: The project would increase in illumination and glare due to project lighting, building surfaces and parking areas. | <p><b>AE-2.1:</b> Parking lot lighting shall employ full cut-off type fixtures. A full cut-off type fixture is a luminaire or light fixture that, by design of the housing, does not allow light dispersion or direct glare to shine above a 90-degree horizontal plane from the base of the fixture. Full cut-off type fixtures must be installed in a horizontal position as designed.</p> <p><b>AE-2.2:</b> The design of external signs and lighting shall prevent direct glare on adjoining properties.</p>   | At the time of plan review, and ongoing during construction and operation of the project. | City of Clovis Planning and Development Services Department – Building Division |                 |

|   | <b>AE-2.3:</b> The design for the buildings east of Medical Center Drive East shall incorporate exterior materials designed to minimize reflective glare from the exterior surfaces.   |  |   |                 |
|---|--|--|---|-----------------|
| <b>AIR QUALITY</b>  |  |  |   |                 |
| <b>IMPACT</b>   | <b>MITIGATION MEASURES</b>   | <b>TIMING</b>  | <b>MONITORING AGENCY</b>  | <b>SIGN OFF</b> |
| AQ-1: The project would increase long-term operational emissions of particulate matter and ozone precursor emissions. | <p><b>AQ-1.1:</b> Operation of the proposed project shall comply with SJVAPCD's ISR rule (Rule 9510). Accordingly, an Air Impact Assessment (AIA) shall be prepared for the proposed Project. The AIA shall be submitted to and approved by the SJVAPCD prior to issuance of construction/grading permits by the City of Clovis. The AIA shall include: an estimate of operational emissions prior to the implementation of mitigation measures; a list of the mitigation measures to be applied to the project; an estimate of emissions for each applicable pollutant for the project, or each phase thereof, following the implementation of mitigation; and a calculation of the applicable off-site fee, if required by Rule 9510. Measures that may be implemented to reduce operational emissions may include, but are not limited to, the following:</p> <ul style="list-style-type: none"> <li>(a) Utilize green building materials (materials which are resource efficient, recycled, and sustainable) available locally if possible.</li> <li>(b) Provide shade tree planting in parking lots to reduce evaporative emissions from parked vehicles. Design should provide 50% tree coverage within 10 years of construction using low ROG emitting, low maintenance native drought-resistant trees.</li> <li>(c) Plant drought tolerant native shade trees along southern exposures of buildings to reduce energy used to cool buildings in summer.</li> <li>(d) Incorporate outdoor electrical outlets to encourage the use of electric landscape maintenance equipment.</li> <li>(e) Install high-efficiency heating and cooling systems.</li> <li>(f) Utilize high-efficiency gas or solar water heaters.</li> <li>(g) Utilize built-in energy-efficient appliances (i.e., Energy Star rated).</li> <li>(h) Utilize double- or triple-paned windows.</li> <li>(i) Utilize low energy street lights (i.e., sodium, light-emitting diode [LED]).</li> <li>(j) Utilize energy-efficient interior lighting.</li> </ul> | Prior to the commencement of grading activities and ongoing during grading and construction. | City of Clovis Planning and Development Services Department – Planning and Building Divisions |                 |

|  |  |  |  |  |
|--|--|--|--|--|
|  | <p>(k) Install low water consumption landscape. Use native plants that do not require watering after they are well established or minimal watering during the summer months and are low ROG emitting.</p> <p>(l) Provide a minimum of one designated parking space for alternatively fueled vehicles.</p> <p>(m) Use low-VOC content paints during construction and long-term facility maintenance. To the extent possible construction materials that are prefinished or that do not require the application of architectural coatings should be used.</p> <p>(n) Install energy-saving systems in rooms that reduce energy usage associated with HVAC systems and appliances when rooms are not occupied, except where such systems would pose a safety or health concern.</p> <p>(o) Provide a pedestrian access network that internally links all uses and connects all existing or planned external streets and pedestrian facilities contiguous with the project site.</p> <p>(p) Provide on-site bicycle parking beyond those required by California Green Building Standards Code and related facilities to support long-term use (lockers, or a locked room with standard racks and access limited to bicyclists only).</p> <p>(q) Implement traffic calming improvements as appropriate (e.g., marked crosswalks, count-down signal timers, curb extensions, speed tables, raised crosswalks, median islands, mini-circles, tight corner radii, etc.)</p> <p><b>AQ-1.2:</b> A Voluntary Emissions Reduction Agreement (VERA) shall be entered into with the SJVAPCD to reduce operational emissions of ROG and NOX to less than 10 tons/year and emissions of PM10 to below 15 tons/year. Operational emissions of ROG, NOX and PM10 (inclusive of PM2.5) shall be reduced in excess of the reductions required per compliance with SJVAPCD's ISR Rule (Refer to Mitigation Measure AQ-1). Emission reductions may be achieved by use of newer, low-emission equipment, implementation of on-site or off-site mitigation, and/or the funding of off-site mitigation, through participation in the SJVAPCD's off-site mitigation program. The project development plans are long term and conceptual in nature and subject to change in uses and extent otherwise allowed by City zoning that have lesser or equal impacts to those assessed in the EIR. VERA emission estimates shall be based on project-specific modeling assumptions where available (e.g., truck trip generation). Modeling performed shall account for declining emissions during the 10-year mitigation period due to vehicle turnover projected by the latest State approved emission models. VERA emission estimates may be revised to reflect actual development plans proposed for the site at the time each building or phase is finalized.</p> |  |  |  |
|--|--|--|--|--|

|  |  |   |   |  |
|--|--|---|---|--|
|  | <p>VERA mitigation fee payments for a building or phase may be deferred until no later than 30 days prior to commencing construction activities for the building or phase. The VERA shall be reviewed and approved by the SJVAPCD prior to issuance of construction/grading permits by the City of Clovis. The project proponent/owner shall submit to the City of Clovis Planning Department documentation confirming entering into the VERA, prior to issuance of final discretionary approval (e.g., approval of the grading permit for the first construction project relying on this EIR). Development and implementation of the VERA shall be fully funded by the project proponent/owner as development progresses. With approval by SJVAPCD, the VERA may also be used to demonstrate compliance with emission reductions required by SJVAPCD's ISR Rule (Rule 9510).</p>  |   |   |  |
| <p>AQ-2: Impacts to sensitive receptors may occur due to localized PM concentrations from construction activities and air emissions from stationary sources.</p> | <p><b>AQ-2:</b> Implement Measures to Reduce Localized Pollutant Concentrations</p> <p>(a) Potential health risks associated with permitted stationary sources (e.g., emergency generators) shall be evaluated prior to installation and operation, once more detailed equipment specifications have been identified and in accordance with SJVAPCD's permitting requirements. Emissions control measures and/or operational limitations shall be incorporated, to the extent deemed necessary, to ensure that operational emissions would not exceed applicable SJVAPCD's significance thresholds for cancer risk of 20 in one million or an acute/chronic hazard index of one.</p> <p>(b) The following measures shall be implemented to reduce potential exposure of sensitive receptors to localized concentrations of construction-generated PM at nearby sensitive receptors and land uses during project construction:</p> <ol style="list-style-type: none"> <li>1. On-road diesel vehicles shall comply with Section 2485 of Title 13 of the California Code of Regulations. This regulation limits idling from diesel-fueled commercial motor vehicles with gross vehicular weight ratings of more than 10,000 pounds and licensed for operation on highways. It applies to California and non-California based vehicles. In general, the regulation specifies that drivers of said vehicles: <ul style="list-style-type: none"> <li>• Shall not idle the vehicle's primary diesel engine for greater than 5 minutes at any location, except as noted in Subsection (d) of the regulation; and,</li> <li>• Shall not operate a diesel-fueled auxiliary power system to power a heater, air conditioner, or any ancillary equipment on that vehicle during sleeping or resting in a sleeper berth for greater than 5.0 minutes at any location when within 1,000 feet of a restricted area, except as noted in Subsection (d) of the regulation.</li> </ul> </li> <li>2. Off-road diesel equipment shall comply with the 5-minute idling restriction identified in Section 2449(d)(2) of the California Air Resources Board's In-Use Off-road Diesel regulation. |--|---|--|--|--|
|  | <p>listed VPFS and/or other non-listed vernal pool branchiopods including midvalley fairy shrimp and California linderiella:</p> <p>(a) Effects of permanent losses and degradation of VPFS habitat shall be minimized and, to the greatest extent practicable, habitat restored. Before discharge of fill material, creation and/or preservation credits (amount TBD with consultation with USFWS) will be obtained from a USFWS-approved mitigation bank for every acre of habitat directly or indirectly impacted.</p> <p>(b) Staging areas shall be located away from the seasonal wetlands and channels.</p> <p>(c) Temporary stockpiling of excavated or imported material shall occur only in approved construction staging areas. Excess excavated soil shall be used onsite or disposed of at a regional landfill or other appropriate facility.</p> <p>(d) A USFWS-approved biologist conduct habitat sensitivity training related to VPFS for all project contractors and personnel.</p> <p><b>BR-1.3:</b> Avoidance.</p> <p>If feasible, any vegetation removal will take place between September 1 and February 1 to avoid impacts to nesting birds in compliance with the Migratory Bird Treaty Act. If vegetation removal must occur during the nesting season, project construction may be delayed due to actively nesting birds and their required protective buffers.</p> <p><b>BR-1.4:</b> Pre-Construction Surveys.</p> <p>(a) If vegetation removal or ground disturbance will commence between February 1 and August 31, a qualified biologist will conduct a pre-construction survey for nesting birds within 14 days of the initiation of disturbance activities. This survey will cover:</p> <p>(1) Potential nest sites in trees, bushes, or grass within species-specific buffers of the project area (Swainson's hawk – 0.5 mile, other raptor species such as white-tailed kite – 500 ft, non-raptor species (loggerhead shrike, magpie etc. – 250 ft).</p> <p>(2) Survey protocol developed by the Swainson's Hawk Technical Advisory Committee (TAC) should be followed (CDFG 2000), which includes survey timing and requirements for repeated visits.</p> <p>(b) Surveys for burrowing owl will occur within 14 days prior to any ground disturbance, no matter the season. This survey will cover potential burrowing owl burrows in the project area and suitable habitat within 150 m (500 ft). Evaluation of use by owls shall be in accordance with California Department of Fish and Wildlife survey guidelines (CBOC 1993, CDFG 1995, CDFG 2012). Surveys will document if burrowing owls are nesting or using habitat in or directly adjacent to the project area.</p> |  |  |  |
|--|---|--|--|--|

|  |   |  |  |  |
|--|---|--|--|--|
|  | <p>Survey results will be valid only for the season (breeding (Feb 1-Aug 31) or non-breeding (Sept 1-Jan 31) during which the survey is conducted.</p> <p>(c) If no active nests or burrows are detected during the pre-construction survey, then no further action is required. If an active nest or burrow is detected, then the minimization measures described in MM BR-5 shall be implemented.</p> <p><b>BR-1.5:</b> Minimization/Establish Buffers.</p> <p>(a) Swainson’s hawk, white-tailed kite, loggerhead shrike, yellow-billed magpie, Nuttall’s woodpecker, oak titmouse, and MBTA-protected species:</p> <p>If any active nests are discovered (and if construction will occur during bird breeding season), the USFWS and/or CDFW will be contacted to determine protective measures required to avoid take. These measures could include fencing off an area where a nest occurs, or shifting construction work temporally or spatially away from the nesting birds. Biologists are required on site to monitor construction while protected migratory birds are nesting in the project area. If an active nest is found after the completion of the pre-construction surveys and after construction begins, all construction activities will stop until a qualified biologist has evaluated the nest and erected the appropriate buffer around the nest.</p> <p>(b) Burrowing owl:</p> <p>If burrowing owls are detected within the survey area, CDFW should be consulted to determine the suitable buffer. These buffers will take into account the level of disturbance of the project activity, existing disturbance of the site (vehicle traffic, humans, pets, etc.), and time of year (nesting vs. wintering). If avoidance is not feasible, the City will work with CDFW to determine appropriate mitigation, such as passive exclusion or translocation, and associated mitigation land offset (CDFG 2012).</p> <p>If avoidance is not feasible, as per the General Plan Update PEIR (City of Clovis 2014), “A qualified biologist will develop appropriate mitigations that will reduce project impacts to sensitive or protected biological resources to a less than significant level. The type and amount of mitigation will depend on the resources impacted, the extent of the impacts, and the quality of habitats to be impacted. Mitigations may include, but are not limited to: 1) Compensation for lost habitat or waters in the form of preservation or creation of in-kind habitat or waters, either onsite or offsite, protected by conservation easement; 2) Purchase of appropriate credits from an approved mitigation bank servicing the Clovis General Plan Update Area; 3) Payment of in-lieu fees.”</p> |  |  |  |
|--|---|--|--|--|

|  |   |   |   |  |
|--|---|---|---|--|
| <p>BR-2: The widening of Herndon Avenue would impact 0.204 acres of wetlands.</p>                | <p><b>BR-2.1:</b> The City of Clovis shall obtain a Section 404 CWA Nationwide Permit (#14 for linear transportation projects) from the ACOE for impacts to wetlands and waters of the United States and comply with the mitigation measures identified in the permit to prevent discharge of pollutants to surface waters during construction. This shall include complying with the State's National Pollution Discharge Elimination System (NPDES) General Permit for Discharges of Storm Water Runoff Associated with Construction Activity (General Permit) issued by the Central Valley Regional Water Quality Control Board (CVRWQCB). A Section 401 Water Quality Certification must be obtained from the RWQCB for all proposed impacts to Waters of the State. A Section 1602 Lake and Streambed Alteration Agreement, if required by CDFW, must be obtained prior to the placement of any fill within the seasonal swale in the Project Area. Though the Nationwide Permit process, the ACOE will also submit a Biological Assessment to USFWS to initiate formal consultation under Section 7 of FESA to determine if the action could result in the incidental take of a federal listed species (in this case VPFS).</p> <p><b>BR-2.2:</b> To mitigate for impacts to waters and/or wetlands, at least one of the following measures shall be incorporated:</p> <p>(a) credits will be purchased from an approved mitigation bank (typically at a 2:1 or 3:1 ratio; to be determined in consultation with ACOE and USFWS); or</p> <p>(b) a creation, restoration, or preservation project will be identified in the vicinity; or</p> <p>(c) mitigation performed as otherwise directed by regulatory agencies during permit preparation.</p> <p>Mitigation will be implemented prior to or concurrent with filling jurisdictional waters and/or wetlands. Since the waters to be impacted by the road widening overlap with potential VPFS habitat, VPFS mitigation may incorporate a portion of the required wetland/waters mitigation acreage.</p> | <p>Prior to the commencement of grading activities and ongoing during grading, construction, and operation.</p> | <p>City of Clovis Planning and Development Services Department – Engineering Division</p> |  |

## CHAPTER 4

### Responses to Draft EIR Comments

---

This section includes the comments received on the Draft EIR and the responses of the City of Clovis to the comments. Each comment within the letters has been assigned a reference number that corresponds to the number assigned to each response. For reference and as required by CEQA Guidelines Section 15132(c), a list of the persons, organizations and public agencies who submitted comment letters is presented below.

| <b>Comment No.</b> | <b>Agency or Person</b>   | <b>Comment Date</b> | <b>Page No.</b> |
|--------------------|---|---------------------|-----------------|
| 1                  | Jan Kedwards  | February 21, 2018   | 4-2             |
| 2                  | County of Fresno, Department of Public Health                   | March 21, 2018      | 4-8             |

Subject: Medical Center Expansion

Good morning,

Our home backs up to the Enterprise Canal directly behind the medical center. We received your notice yesterday and are very disheartened by it. This will have extremely negative effects on this area including everything mentioned in your "Potential Project Impacts". Even though you state that some of these significant effects "could be reduced to insignificance by mitigation measures", in reality there isn't anything they can do to mitigate the aesthetic effects when replacing the still somewhat rural feel with more concrete and asphalt no matter how nice they think their buildings are.

You are admitting that "greenhouse gas emissions and increased noise levels from traffic sources" can not be reduced to insignificant. These things will have a significant effect on the quality of life for the residences in the area and possibly a significant effect on the value of our properties.

Something you didn't mention is the significant noise levels from the continued construction. It's bad enough that we have to listen to it all day long within the noise ordinance allowances, but we have to start listening to it far, far sooner than 6:00 a.m. during the summer and 7:00 a.m. in the winter and 9:00 a.m. on the weekends. I have literally heard the beeping of a vehicle backing up in the equipment yard as early as 3:15 a.m. and a starting time of 4:00 a.m. for construction is not abnormal at all.

Why does the noise ordinance not apply to the medical center's contractors? The construction equipment yard backups to the Enterprise Canal at our property, so I am hyper aware of the lights and the noises from that area.

This whole issue is very concerning for us and the first thing we tried to do was to review the Draft EIR online as directed and we couldn't find it. Would you please email us instructions on how to get to it from [www.cityofclovis.com](http://www.cityofclovis.com).

Thank you,

Jan Kedwards

Subject: Re: Medical Center Expansion

Hi Bryan,

Thank you for the link and possibly doing something about the early construction start times.

After reviewing the plan, there is nothing but really bad news for us. On Figure 3.1 - CCMC Expansion Area Photos the #10 arrow lines up exactly with our property. One of our new views in the next couple of years is going to be the parking garage. I couldn't find anything as to how many stories the parking garage is going to be or whether or not it is going to be completely enclosed. If it's not enclosed we will be subject to the noises of car doors opening and closing and people conversing while walking to and from their vehicles, in addition to an ugly view. Please tell me how many stories the parking garage is going to be; whether or not it is going to be fully enclosed and confirm for me that the helistop is not going to be moved to the top of the garage.

Thank you,

Jan Kedwards

<BryanA@ci.clovis.ca.us> wrote:

Hi Jan:

The hospital campus has undergone several amendments to address growth within their campus since it moved to this location. The proposed parking garage was approved adjacent to the Enterprise Canal in 2008 . The new proposal moves the garage further from the neighborhood to the west side of the internal looped road. The issue of lights, visibility and height were all brought up at the time from some of your neighbors. The height will be the same as their existing garage.

Although there are new buildings proposed on the campus, most were approved in previous EIR's. Much of the current EIR addresses development on the west side of Temperance Avenue and south of Herndon Avenue.

The helistop is proposed to be moved. We went through significant discussion in the 2008 EIR and the result was that the hospital decided to leave it in its place.

Hope this clarifies.

Bryan

Subject: Re: Medical Center Expansion

Date: February 21, 2018 at 4:24:46 PM PST

To: Bryan Araki [BryanA@ci.clovis.ca.us](mailto:BryanA@ci.clovis.ca.us)

Hi Bryan,

We purchased our home on Traverse in October, 2008. We went to subsequent meetings regarding the expansion. What I recall is the parking garage was going to be south of us. If it was going to line up with our property, I would certainly remember that. I know there was a map of the plan posted on the internet at the time but I'm not able to find it now. Would you please send me the link to that map to help refresh my memory.

You didn't address whether the garage is going to be a fully enclosed structure. Is it?

I do clearly recall the discussions about the helistop. It made a big impression on me because at some point it was proposed that it be between our property and the property directly to our south, where the equipment yard is now. That was going to be a temporary location until the parking garage was built and then the helistop was going to be on the top of the parking garage. There wasn't a single Traverse resident that agreed that it should be on the east side of the medical center's property but that didn't concern the City of Clovis or the medical center's owners. Where is the proposed new location of the helistop?

1-5

I also remember that the medical center committed to planting trees along the eastern border of their property. That hasn't happened except at the very northern end of the property. Had they planted the trees, the negative impact of the new structures going in would not be so substantial for residents along the eastern border.

I look forward to your response.

Jan

Subject: 2008 Plan Map

Bryan,

I don't need the link from you for the 2008 plan. I found a pdf of it. My recollection was 100% correct. The parking garage was going to be south of us, not at all in our view. The parking garage was also going to be operational in 2030, ten years later than what is being proposed now.

1-6

My husband and I have been married for fifty years. The last twenty-five years we've sacrificed doing fun things, going on vacations or relaxing, to instead work on our homes to build sweat equity. That hard work and those sacrifices are most likely going to be all for naught now because of Clovis Community Medical Center and the City of Clovis. I can't believe that having a three story garage with a helicopter pad on top of it, within yards of our property and in clear view, is not going to significantly diminish the value of our property. We'll be lucky now if we can even get out of this property what we have into it. The sweat equity that we've worked so hard for all those years, so that we could have a nice home in our golden years, is now probably gone. We're the little guys though, so there's nothing we can do about it.

Jan

## **Response to Jan Kedwards**

### **Response 1-1**

As a background note, this comment consists of a series of email messages between Jan Kedwards, a neighboring property owner, and Bryan Araki, City Planner for the City of Clovis.

In her initial email to the City of Clovis, Ms. Kedwards identifies the location of her residence and states concerns regarding aesthetic impacts and a conversion of the “still somewhat rural feel” of the area. The concerns regarding aesthetics are addressed in Response 1-3. The comment also notes, as concluded in the Draft EIR, that certain impacts related to Greenhouse Gas Emissions and Noise cannot be reduced to an insignificant level. While the significant and unavoidable impacts of the project are acknowledged, the environmental review process allows for such impacts to be weighed by decision-makers against the benefits of the proposed project.

### **Response 1-2**

This is the response that was provided by the City of Clovis to address Ms. Kedwards’ first email in which she expressed concerns about construction noise during early-morning hours and issues with accessing a copy of the Draft EIR. Mr. Araki’s reply included a link to an electronic copy of the Draft EIR and a statement indicating he would address the construction start times.

Regarding the concern about early-morning construction noise, Mr. Araki contacted Community Medical Providers to obtain information about past construction activities occurring outside of daytime hours. Staff from Community Medical Providers responded that the early-morning construction noises identified in Ms. Kedwards’ letter could have occurred during construction of CCMC’s Cancer Center building, which apparently involved a specific lengthy concrete pouring process that was required as part of the project’s design. Going forward, it is recommended that Community Medical Providers adopt and abide by a policy of notifying nearby property owners of any activities that are to occur outside of the normal range of construction hours (7:00 a.m. to 7:00 p.m.), in addition to adhering to Mitigation Measure NO-1, which limits construction to those hours except for activities that would result in a safety concern to the public or construction workers.

### **Response 1-3**

The comments here identify concerns about adverse aesthetic impacts of the parking structure and noise generated from operation of the parking structure. The parking structure will be three stories in height and will not be enclosed. However, the parking garage will be located a substantial distance from Ms. Kedwards’ property--approximately 1,000 feet west of her home and approximately 730 west of her rear property line. In addition, a planned medical office build will be constructed between the parking garage and Ms. Kedwards’ property. Regarding aesthetics, the parking structure would be sited within the horizon of CCMC’s existing development and would be consistent with the size and form of buildings currently present at the campus. Additionally, no changes are proposed regarding the hospital’s helistop; it will not be moving from its current location on the ground at the southern p.

Noise generated from operation and use of the parking structure is addressed under Impact NO-3 (Chapter 15, page 15-20 of the Draft EIR) and in the Noise Analysis prepared for the project. Predicted peak-hour noise levels at the nearest residential land use located to the east of the proposed parking

structure are estimated be approximately 30 dBA  $L_{eq}$ , and predicted average-daily noise levels at this nearest residence are estimated to be approximately 37 dBA CNEL or less. The predicted noise levels at nearby land uses would not exceed the City's exterior or interior noise standards of 65 and 45 dBA CNEL, respectively, and would be largely masked by ambient noise levels. (Also see Response 1-2, which addresses noise from construction activities and the timing of construction activities.)

#### **Response 1-4**

In this email, Mr. Araki provides clarification as to the relationship between the current proposed Project and a prior expansion of the CCMC campus which was approved in 2009 (note: the email references the year 2008 when the prior expansion project was submitted to the City of Clovis, but it was not actually approved until 2009). As noted in in the email, most of the planned development on the east side of the CCMC campus was encompassed in the 2009 CCMC expansion EIR.

Regarding the location of the parking structure, Mr. Araki clarifies that the prior expansion entailed locating a parking structure adjacent to the Enterprise Canal in the southeast portion of the campus (about 500 feet southwest of Ms. Kedwards' property), while the current project entails locating the parking structure further from the homes east of the Enterprise Canal and closer to existing CCMC buildings on the west side of the internal looped road (see Figure 2.3 of the Draft EIR for more detail).

The helistop location will not be moved from where it is now.

#### **Response 1-5**

This email primarily discusses the proposed project in comparison to the prior CCMC expansion which was approved in 2009.

Responses 1-3 and 1-4 address the parking structure's location and design and the fact that the helistop will not be moved from where it is now located.

The 2009 EIR included a mitigation measure requiring trees to be planted along the eastern boundary of the property if the citrus trees were removed. The City will require this to be implemented.

#### **Response 1-6**

The comments regarding the location of the parking structure is addressed in Responses 1-3 and 1-4. The 2009 expansion included a ten-year plan and a long range plan for up to 25-30 years in the future. This means that the long range improvements could be installed any time after ten years and up to 25-30 years. Thus, under the long range plan and counting from 2009, the parking garage could have been built any time between 2019 and 2039, and not specifically 25-30 years from approval of the prior expansion.

The remainder of the email primarily expresses concern about how the project may affect the value of the Kedwards' property. Without an appraisal to indicate current value as compared to prior value, this contention is speculative and unsupported. It is noted that a project's potential impact on the value of a neighboring property is an economic impact that does not require evaluation under CEQA.

### Comment Letter 2

March 21, 2018

LU0019360  
2604

Bryan Araki, City Planner  
City of Clovis  
Planning and Development Services Department  
1033 Fifth Street  
Clovis, CA 93612

Dear Mr. Araki:

SUBJECT: **Notice of Availability of Draft Environmental Impact Report (DEIR)-  
Clovis Community Medical Center Expansion & Herndon Avenue Widening Project**  
PROJECT: **SCH#2016101005**  
LOCATION: **Clovis Community Medical Center (Herndon Avenue between Temperance &  
Dewolf Avenues)**

The Fresno County Department of Public Health, Environmental Health Division has reviewed the Draft Environmental Impact Report (DEIR) documentation for the proposed Clovis Community Medical Center expansion and Herndon Avenue widening project on approximately 148 acres located on the north and south sides of Herndon Avenue, east and west of N. Temperance Avenue and offers the following comments for consideration for the DEIR project:

### Hazards and Hazardous Materials Section

2-1

The hazardous materials section should address potential hazards and hazardous materials during construction and grading activities, there is potential for discovering abandoned underground petroleum storage tank(s). If this occurs, the applicant shall apply for and secure an Underground Storage Tank Removal Permit from the Fresno County Department of Public Health, Environmental Health System. Contact the Certified Unified Program Agency at (559) 600-3271 for more information.

2-2

Similarly, abandoned sewage disposal systems may be discovered during construction and grading activities. All abandoned sewage disposal systems within the unincorporated County shall be properly destroyed under permit and inspection from the Department of Public Works and Planning, Building and Safety Section.

### Hydrology and Water Quality Section

2-3

The Hydrology and Water Quality Section should address the manner in which existing water wells, both domestic and agricultural, will be handled in areas of the proposed project. Areas served by individual domestic and agricultural wells may provide a conduit to groundwater if not properly protected or destroyed. Improper abandonment of such wells presents a significant risk of contaminating groundwater. For this reason, when development occurs, it is extremely important to ensure the safe and proper destruction of all abandoned water wells.

Ryan Burnett- Management Analyst ([RyanB@ci.clovis.ca.us](mailto:RyanB@ci.clovis.ca.us))  
Scott B. Odell- Consultant ([scott@odellplanning.com](mailto:scott@odellplanning.com))

**Response to County of Fresno, Department of Public Health**

**Response 2-1**

Review of existing federal and state databases and the land use history of the site did not reveal any hazardous materials issues. However, the City acknowledges that in the unlikely event of discovering an abandoned underground storage tank during construction, the applicant would be required to secure an Underground Storage Tank Removal Permit from Fresno County Environmental Health System.

**Response 2-2**

The City acknowledges the any abandoned sewage disposal systems discovered during construction in unincorporated County territory would be required to be properly destroyed under permit and inspection from the Department of Public Works and Planning, Building and Safety Section.

**Response 2-3**

The City is not aware of any existing wells that would be affected by project development but acknowledges that improper abandonment of wells presents a significant groundwater contamination risk. Any wells to be abandoned would be handled in accordance with state and local regulations requiring proper closure.

Re: Herndon Ave. Widening Project

3-1

Since Herndon Ave. is being turned into a major thoroughfare through Clovis AND DeWolf Ave. has become the largest feeder street unto the large Loma Vista development, my property is bearing much of the risk to these expansions. As I view this, the widening proposal is not being done correctly, and the creation of a “choke point” at the Enterprise Canal is concerning. As I read this, the widening project is NOT going far enough to ensure smooth traffic and safe flow of fast moving cars.

I live at the corner of Herndon and DeWolf Ave., and I have great concerns over the attempt to widen Herndon to the southern leg of DeWolf Ave. The increased environmental, noise, and safety issues to my property and family are not being addressed correctly.

*Below are my concerns:*

3-2

**Environmental:** The pollution from increased cars is not being mitigated. Your report states in table 5.5 that my house levels for NOx will be 60.8, CO will be 43.2, and PM10 will be 8.0. These exceed California standards and will put my family to additional health risk if not mitigated correctly.

3-3

**Noise:** Noise pollution is already higher than previous years, but will only become worse with your widening project. Your current study states levels will be as high as 79 dBA in traffic and 68 dBA within 50 feet of the DeWolf intersection. My house is 50 feet from this intersection and this is concerning. Studies show that noise levels above 60 dBA have detrimental medical and hearing effects on most populations.

We agree with the report that, “A large object or barrier in the path between a noise source and a receiver can substantially attenuate noise levels at the receiver.” (15-2) I see no plans to mitigate this noise.

3-4

**Safety:** The choke point will create MANY MORE accidents. Your proposal is creating a safety hazard against my fence and property. Currently, the corner of Hendon and DeWolf has a major

accident every 3 months as people try to pass at the left turn on Herndon. This creating of a new choke-point at the Enterprise Canal Bridge will put all these accidents into my back-yard.

3-4

Your studies show that >1000 cars cross next to my back yard every hour in 2016, and all have to protect my family is a chain-link fence. Cars repeatedly hit this fence now, and your project is not dealing with this increased safety risk. As the number doubles into the next year, what is being done to protect the family and play and the animals I keep along Herndon?

3-5

**Conclusion:** We ask that this project be better planned on how expansion and traffic will be ruined on either side of the Enterprise Canal Bridge. We ask that a re-do of the Herndon Expansion be considered to take into these issues raised above.

Thank you for your consideration,

A handwritten signature in blue ink, reading "George Leighton Allen, Jr." in a cursive script.

George Leighton Allen, Jr.

## **Response to George Leighton Allen**

### **Response 3-1**

The first two paragraphs consist of introductory information that identifies the location of Mr. Allen's property and introduces the scope of Mr. Allen's concerns regarding the proposed widening of Herndon Avenue (i.e. air quality, noise, traffic/safety). The responses below address these concerns.

### **Response 3-2**

Table 5.5 referred to in the comment letter provides information on average daily construction generated emissions. It indicates that uncontrolled average daily emissions for the Herndon Avenue widening in pounds per day will be 6.4 for ROG, 60.8 for NOX, 43.2 for CO, 0.0 for SO<sub>2</sub>, 8.0 for PM<sub>10</sub>, and 3.2 for PM<sub>2.5</sub>. The San Joaquin Valley Air Pollution Control District's significance threshold per day for each of these pollutants is 100 pounds per day. The project is substantially under the significance thresholds for these pollutants. Regarding long term operational air pollutant emissions, a substantial component of which is mobile source emissions (motor vehicles), the Draft EIR concluded that the impact would be less than significant with the implementation of the mitigation measures provided in the document.

### **Response 3-3**

As discussed in Draft EIR Chapter 15, Noise, Mitigation Measure NO-2 would require the preparation of an acoustical analysis for the widening of Herndon Avenue once detailed plans for lane configurations and alignments become available. The acoustical analysis would be required to evaluate changes in traffic noise levels in comparison to the City of Clovis General Plan noise standards, and noise-reduction measures (e.g., sound walls) will be evaluated and implemented where feasible. The Draft EIR determined traffic noise associated with the widening of Herndon Avenue would be considered significant and unavoidable because in some instances the use of noise-reduction measures, such as sound walls, may not be feasible due to the need to preserve access to noise sensitive properties. However, for some properties, the addition of a noise barrier may be beneficial. The required acoustical analysis will determine this.

### **Response 3-4**

The widening of Herndon Avenue is necessary as an implementation of the Clovis General Plan's designation for the roadway as an arterial street to handle projected additional traffic due to planned growth in accordance with the adopted General Plan. A "choke point" where the roadway would narrow to two lanes west of the Enterprise Canal Bridge is not expected to develop. However, if traffic were to back up, it would occur substantially west of Mr. Allen's residence (west of the bridge), as it is eastbound traffic that would be heading into the narrowing roadway. Traffic traveling west would not back up because the roadway would be widening. Thus, the new configuration of the roadway would not create a substantial additional safety issue in relation to Mr. Allen's property.

**Response 3-5**

The text here consists of summary/concluding remarks from Mr. Allen's letter. No additional response is necessary.

Comment Letter 4

Bryan Araki  
City of Clovis  
Department of Planning and Development Services  
1033 Fifth Street  
Clovis, CA. 93612

RE: Notice of Availability of a Draft Environmental Impact Report for Clovis  
Community Medical Center Expansion and Herndon Avenue Widening Project  
FID Facilities: Enterprise No. 109, Clovis No. 115

Dear Mr. Araki:

The Fresno Irrigation District (FID) has reviewed the Draft Environmental Impact Report for Clovis Community Medical Center Expansion and Herndon Avenue Widening Project. Clovis Community Medical Center Expansion consists of 148 acres in size and lies within the north and south sides of Herndon Avenue, east and west of Temperance Avenue, within Fresno County. The Herndon Avenue Widening Project would extend from Temperance Avenue on the west to the southern leg of DeWolf Avenue on the east encompassing a distance of one-mile. FID's comments are as follows:

### Impacted Facilities

1. FID has facilities within the project location as shown on the attached FID exhibit map. The major facilities are: Enterprise No. 109 and Clovis No. 115. FID's canals range from a medium diameter pipeline to a large open canal. In many cases, the existing facilities will need to be relocated to accommodate new urban developments which will require new pipelines and new exclusive easements. FID anticipates it will require the same conditions on future projects as it would with any other project located within the common boundary of the City of Clovis and FID.
2. FID's Enterprise No. 109 runs northwesterly, traverses the northern portion of the project location, as shown in the attached FID exhibit map. FID's records indicate a recorded easement for the affected portion of open channel, recorded on May 3, 1991 as Document No. 91052869, Official Records of Fresno County, and will be impacted by the proposed developments.

4-1

3. FID's Clovis No. 115 runs westerly along the north side of Herndon Avenue, traverses the southern portion of the Clovis Community Medical Center in a 30 feet wide exclusive easement (i) recorded November 21, 1961, as Document No. 85505, in Book 4639, on Page 430, Official Records of Fresno County. And (ii) November 22, 1961, as Document No. 85786, in Book 4640, on Page 38, Official Records of Fresno County, and will be impacted by the proposed developments.
4. FID's facilities that are within the project location carry irrigation water for FID users, recharge water for the City of Fresno and Clovis, untreated drinking water for the City of Fresno, and flood waters during the winter months.
5. FID requires that, within the limits of the proposed project [and its remainder], the landowner(s) grant an exclusive easement for the land underlying the Enterprise Canal and associated area along the canal required for maintenance pursuant to Water Code Section 22425 and FID policy, where FID does not currently have one. FID's District Canal Right-of-Way Requirements sheet is enclosed for your reference. The proposed easement (width) will depend on several factors including: 1) Width of canal, 2) height of canal banks, 3) final alignment of canal, 4) additional space needed where roads/avenues intersect canal, etc.
6. FID requires that the Engineer/Land Surveyor use the inside top hinge of the canal to define the edge of FID's right-of-way such that FID has a minimum 20 feet wide right-of-way along the top of bank to be clear of obstructions, structures, vegetation, etc. to provide clear passage and full width. There are no minimum or suggested numbers of survey shots to take but, there must be enough survey points such that the top inside hinge of the canal bank is properly identified. Before finalizing the Final Maps, the Engineer/Land Surveyor will need to stake both the inside top hinge and the right-of-way/property for FID Staff to field evaluate an adequate width. FID staff must field verify the right-of-way/property boundary and the hinge line edge before signing plans to ensure that there are enough survey points to properly define the canal.
7. Typically, for any type of development that impacts a large open canal or is adjacent to one such as the Enterprise No. 109, FID requires the developer/applicant to improve the canal with either concrete lining, encasing the canal in a box culvert, or other approved means to protect the canal's integrity for an urban setting. FID does not have sufficient information to determine what kind of improvements will ultimately be required as part of the development. The engineers working on the project and FID's engineering staff must meet to discuss specific requirements as discussed below. In order to meet the "urban" standards for the canal, FID will require the following minimum conditions:

- a. Channel Stabilization: The proposed plan does not indicate any improvements to the Canal. If the Developer is not willing to concrete line the Canal or place it underground within a box culvert, they must come up with another means acceptable to and approved by FID to protect the Canal's integrity. On similar projects, Developers typically propose the following:
- i. Surrounding Development – All proposed building pad elevations must be a minimum of 12-inches above the canal's high water.
  - ii. Freeboard – FID typically requires between 1.0 to 1.5 feet of freeboard. Because the Canal is used to route stormwaters, and is one of the larger canals used to convey the stormwater, FID will require a minimum of 1.5 feet of freeboard and a maximum of 2.0 feet. The Developer will be required to either import or export material to match FID's standards.
  - iii. Maintenance – this reach of Canal does have a history of high loads of sediment deposits which requires periodic dredging. FID will typically dredge the Canal and deposit the spoils on top of the banks to dry out. Once the spoil has dried, FID will flatten the spoil as time permits. The hauling off of this material may occur several weeks after the deposit has been placed on the side of the canal, and the silts may be considered a nuisance (sight and smell). If the Developer, Applicant and/or City require a different level of maintenance effort, they will need to enter into an agreement for that purpose. The Developer, Applicant, and/or City will be responsible to fund the "higher level" of maintenance.
- b. Drive banks/maintenance roads and encroachments (both banks):
- i. One or both of the drive banks must be sloped a minimum of 2% away from the canal with provisions made for rainfall. Drainage will not be accepted into the Canal and must be routed away from FID property/drive banks. Runoff must be conveyed to nearby public streets or drainage system by drainage swales or other FID acceptable alternatives. Any drainage systems or swales proposed must be located outside FID's property/easement.
  - ii. One or both of the drive banks shall be overlaid with 3 inches of Class II aggregate base for all-weather access and for dust suppression. Aggregate to be a minimum of 20 feet wide along the top of the drive banks.

iii. Encroachments - All existing trees, bushes, debris, fencing, and other structures must be removed within FID's property/easement.

8. Trail - It is FID's understanding that a trail is master-planned along the Enterprise Canal. As with other developments with trails proposed along the canals, FID will not allow the trail to encroach/overlap FID's canal easement. The following requirements are intended for trail projects adjacent to FID-owned properties and right-of-ways for open canals:

- a. FID will not allow the trail easement to be in common use with FID-owned property or easements.
- b. FID requires all trail improvements be placed outside of FID-owned properties and easements.
- c. FID will not allow any portion of a tree canopy to encroach within its properties or easements.
- d. FID's canals will not accept any drainage from the trail or the canal bank.
- e. FID may require some improvements be made to the canal depending on the existing canal condition, the proposed trail, and the adjacent development.

9. If a fence will be installed between the development and open canal, a block/masonry wall shall be required. Chain-link and wood fencing will no longer be accepted for urban developments.

#### Water Impact

- 1. It appears the land within the Project Area for the medical center lies within the limits of the City of Clovis, however, eastern portion of the Herndon Avenue Project lies outside the limits of the City of Clovis.
- 2. The potential for increase in water consumption by the project will result in additional groundwater overdraft. There is a significant cone of depression beneath the City of Clovis. FID is concerned that the increased water demand due to a change in land use will have a significant impact to the groundwater quantity and/or quality underneath the City of Clovis, FID and the Kings Groundwater Sub-basin. The "demand" side of water consumed needs to be evaluated or scrutinized as much as the "supply" side of the water supply. The area was historically native, rural residential, and agricultural with minimal to no water use. Under current circumstances the project area is experiencing a modest but continuing groundwater overdraft. Should the proposed expansion result in a significant increase in dependence on groundwater, this deficit will increase. FID recommends the City of Clovis require the proposed development balance anticipated groundwater use with sufficient recharge of imported surface

water in order to preclude increasing the area's existing groundwater overdraft problem.

4-3

3. As noted in the Draft EIR, California enacted landmark legislation in 2014 known as the Sustainable Groundwater Management Act (SGMA). The act requires the formation of local groundwater sustainability agencies (GSAs) that must assess conditions in their local water basins and adopt locally-based management plans. FID and the City of Clovis are members of the North Kings Groundwater Sustainability Agency which will manage the groundwater basin within the FID service area. This area is in an overdrafted groundwater basin and SGMA will impact all users of groundwater and those who rely on it. The City of Clovis should consider the impacts of the development on the City's ability to comply with the requirements of SGMA.

4-4

4. The Clovis Community Medical Center Expansion and Herndon Avenue Widening Project (*Responsible Agencies* page 2-7) states that "The Fresno Irrigation District must review and approve any project improvements that may encroach or adversely affect the Enterprise No. 109". This statement must be revised to state, "FID requires it review, approve and be made a party to signing all improvement plans which affect its property/easements and canal/pipeline facilities including, but not limited to Sewer and Water, FMFCD, Street, Landscaping, Dry Utilities, and all other utilities".

4-5

5. The Clovis Community Medical Center Expansion and Herndon Avenue Widening Project (*Hydrologic Settings* page 12-1) states that the Enterprise Canal is maintained by the Fresno metropolitan flood control district. This is incorrect, the Fresno Irrigation District (FID) owns, operates, and maintains this facility.

4-6

6. This same section, *Irrigation Systems Integration* on page 4.15-32, also states that whether a canal is left as-is, improved, or replaced with a pipeline is determined by the developer of the project. This is not true. The City of Clovis Municipal Code requires all irrigation or drainage canals of a capacity which can be accommodated by a pipeline having an inside diameter of fifty-four inches or less will be required to be piped and trash racks be installed at all newly constructed headwalls or pipe inlets. It should also be noted that all work, whether left as canal or piped, must be improved to meet FID's standards and requirements for an urban setting.

4-7

7. Discharges into FID Canals – FID will not allow any discharges into the canals for numerous reasons, including but not limited to: Federal/ State/Local regulations, FID's Rules and Regulations, and the potential negative impact to water quality. All new and existing discharges and runoff must be routed to FMFCD storm drain facilities.

water in order to preclude increasing the area's existing groundwater overdraft problem.

4-3

3. As noted in the Draft EIR, California enacted landmark legislation in 2014 known as the Sustainable Groundwater Management Act (SGMA). The act requires the formation of local groundwater sustainability agencies (GSAs) that must assess conditions in their local water basins and adopt locally-based management plans. FID and the City of Clovis are members of the North Kings Groundwater Sustainability Agency which will manage the groundwater basin within the FID service area. This area is in an overdrafted groundwater basin and SGMA will impact all users of groundwater and those who rely on it. The City of Clovis should consider the impacts of the development on the City's ability to comply with the requirements of SGMA.

4-4

4. The Clovis Community Medical Center Expansion and Herndon Avenue Widening Project (*Responsible Agencies* page 2-7) states that "The Fresno Irrigation District must review and approve any project improvements that may encroach or adversely affect the Enterprise No. 109". This statement must be revised to state, "FID requires it review, approve and be made a party to signing all improvement plans which affect its property/easements and canal/pipeline facilities including, but not limited to Sewer and Water, FMFCD, Street, Landscaping, Dry Utilities, and all other utilities".

4-5

5. The Clovis Community Medical Center Expansion and Herndon Avenue Widening Project (*Hydrologic Settings* page 12-1) states that the Enterprise Canal is maintained by the Fresno metropolitan flood control district. This is incorrect, the Fresno Irrigation District (FID) owns, operates, and maintains this facility.

4-6

6. This same section, *Irrigation Systems Integration* on page 4.15-32, also states that whether a canal is left as-is, improved, or replaced with a pipeline is determined by the developer of the project. This is not true. The City of Clovis Municipal Code requires all irrigation or drainage canals of a capacity which can be accommodated by a pipeline having an inside diameter of fifty-four inches or less will be required to be piped and trash racks be installed at all newly constructed headwalls or pipe inlets. It should also be noted that all work, whether left as canal or piped, must be improved to meet FID's standards and requirements for an urban setting.

4-7

7. Discharges into FID Canals – FID will not allow any discharges into the canals for numerous reasons, including but not limited to: Federal/ State/Local regulations, FID's Rules and Regulations, and the potential negative impact to water quality. All new and existing discharges and runoff must be routed to FMFCD storm drain facilities.

### **Agricultural Land Impact**

4-8

1. The FID water allocated to the agricultural land within FID boundary would be converted onto City water rates, as required, by the current agreement and any subsequent agreement or agreements between the City and FID.

4-9

1. The proposed land use (or change in land use) should be such that the need for water is minimized and/or reduced so that groundwater impacts to the proposed project area and any surrounding areas are eliminated.

4-10

3. California enacted landmark legislation in 2014 known as the Sustainable Groundwater Management Act (SGMA). The act requires the formation of local groundwater sustainability agencies (GSAs) that must assess conditions in their local water basins and adopt locally-based management plans. FID and the City of Clovis are members of the North Kings Groundwater Sustainability Agency which will manage the groundwater basin within the FID service area. This area is completely reliant on groundwater pumping and SGMA will impact all users of groundwater and those who rely on it. The City of Clovis should consider the impacts of the development on the City's ability to comply with requirements of SGMA.

### **Road Improvement Impact**

4-11

1. There will be many FID canals impacted by future road improvements to meet the traffic demands. Significant effort will be required to allow for such growth and expansion in a manner that allows FID to maintain and operate its facilities in an efficient and effective manner.

4-12

2. Herndon Avenue will not be able to be expanded to the north because of the Enterprise No. 109 Canal. All expansions of Herndon Avenue must be located on the south side of the road or the canal be relocated and reconstructed to accommodate the necessary expansion(s). FID requires a 20 feet wide right-of-way for operations and maintenance on both sides of the canal (which currently FID does not fully have). As the area develops under the City of Clovis and the traffic increases, it will be significantly more difficult and hazardous for FID to maintain and operate the Enterprise Canal without road closures and/or traffic control unless the canal right-of-way is in place. The City needs to consider these issues in development, traffic and road improvements, need for any turn lanes, etc. for the future growth in the area and the expansion of Herndon Avenue. All right-of-way and easements necessary for the full build-out of the area must be obtained now as a part of this development.

### **Parks and Recreation Impact.**

4-13

1. It is our understanding that some of the parks and trails are planned near FID canals which raise concerns for FID operation and maintenance as well as liability. Parks and trails adjacent to FID facilities will increase the public

exposure to FID's water conveyance system(s) and public safety and liability concerns increase significantly unless properly mitigated. As seen in recent court cases, the trail immunity provision does not really provide any protection for the trail agency or adjacent properties. The trail, as well as parks, are expected to be free and clear of any and all hazards whether from along the trail or adjacent areas.

2. Protective measures must be considered and provided when planning for parks or trails close to FID open channels. FID is supportive of the City's efforts to provide these open space amenities and is open to discussing various alternatives to provide for public safety. In all situations where the park and/or trail are near FID facilities, there is a need to have a master indemnification agreement between the agencies which protects and indemnifies FID from the public exposure created as a result of the City amenity.
3. As you may be aware, FID is currently working with the City on various tracts within the City where trails have been planned adjacent to FID's right-of-way. While we are earnestly working with City staff on the concerns and issues with the City, there are significant issues and challenges to be resolved.

4-13

FID's most significant concerns on trails and parks near or adjacent to FID canals, are as follows:

- a. Liability/Indemnification – The City will need to indemnify and defend FID from any claims arising from the use of the trails and parks located near, adjacent to, or on FID facilities.
- b. FID's Ability to Perform Operations and Maintenance – Impacts to FID's ability to maintain and operate the canal facilities must be mitigated or minimized to the extent possible. Most of the canals impacted are the larger main canals, including the Enterprise, Gould, and Big Dry Creek canals, are significant features, and require substantial effort to maintain and operate. FID appreciates the City's work and effort in getting the smaller conveyance facilities placed in underground pipelines at the time of development.
- c. Right-of-Way/Property Issues – Legal title or easement rights for the FID facilities need to be provided or obtained.
- d. Design Standards – All improvements must be planned and constructed to not interrupt, interfere, or obstruct FID's ability to maintain and operate its facilities. Parks and trails will be required to be set back a certain distance from the canal and provided a physical barrier, to the extent warranted.

- e. Additional Costs as a result of the proximate trails and parks – The creation of a public trail or park adjacent to or near FID's canal system will result in additional burdens and costs to FID which will need to be mitigated and/or compensated.

4-13

4. When trails and/or parks are planned where there exists FID above-ground structures, FID will require City to provide protective fencing and/or features around the FID structures to ensure public safety. As you are aware, FID's systems were originally designed for an agricultural setting and not the public exposure created by urbanization. As part of a development or redevelopment and when possible, FID's facility should be relocated and realigned, or at a minimum protected, such that conflicts between the urban uses and FID facilities are minimized.

### General Comments

1. FID requires permanent drive approaches to access the Herndon Canal. Subject to the impact of the proposed project, FID's ability to access the canal may be impacted and/or impaired. In order to access the maintenance road with our larger equipment, FID requires a larger drive approach. FID's minimum access requirement off major roadways is 50 feet from edge of right-of-way narrowing to 20 feet wide drive banks (See attached "Drive Approach in Urban Areas" Detail No. 62). The 50 feet in width is defined as starting from the end portion of the bridge/railing outward (away from the bridge). In certain circumstances, a minimum 35 feet wide setback, to allow safe and adequate access has been accepted. Every road and canal intersection is different and therefore each access will be different. The major factors affecting the proposed width will be the angle of the road intersecting the Canal, grade of canal bank vs. County road, median vs. no median, etc.
2. FID requires its easements be shown on all maps/plans with proper recording information, and that FID be made a party to signing the final map.
3. FID requires it review, approve and be made a party to signing all improvement plans which affect its property/easements and canal/pipeline facilities.
4. FID assumes that all utilities will be located within the road right-of-way. FID's existing easements are exclusive and therefore FID will not allow any proposed utilities to be within its right-of-way/easement. FID's requirements will substantially change if any utilities are located within FID's right-of-way/easement.
5. FID requires it review, approve and be made a party to signing all improvement plans which affect its property/easements and canal/pipeline facilities including,

4-14

but not limited to Sewer and Water, FMFCD, Street, Landscaping, Dry Utilities, and all other utilities.

- 4-14
6. FID does not allow FID owned property or easements to be in common use with public utility easements but will in certain instances allow its property to be in common use with landscape easements if the City of Clovis enters into the appropriate agreement with FID. FID requires all block walls, fences, and footings to be located outside of its property and easement.
  7. FID's Engineering Department, (559) 233-7161, shall be notified 48 hours prior to construction affecting FID's facilities. No work shall begin without Contractor first obtaining an FID Permit to Work within Easement and Right-Of-Way. FID will require a permit for each crossing.
  8. As with most developer projects, there will be considerable time and effort required of FID's staff to plan, coordinate, engineer, review plans, prepare agreements, and inspect the project. FID's cost for associated plan review will vary and will be determined at the time of the plan review.
  9. The above comments are not to be construed as the only requests FID will have regarding this project. FID will make additional comments and requests as necessary as the project progresses and more detail becomes available.

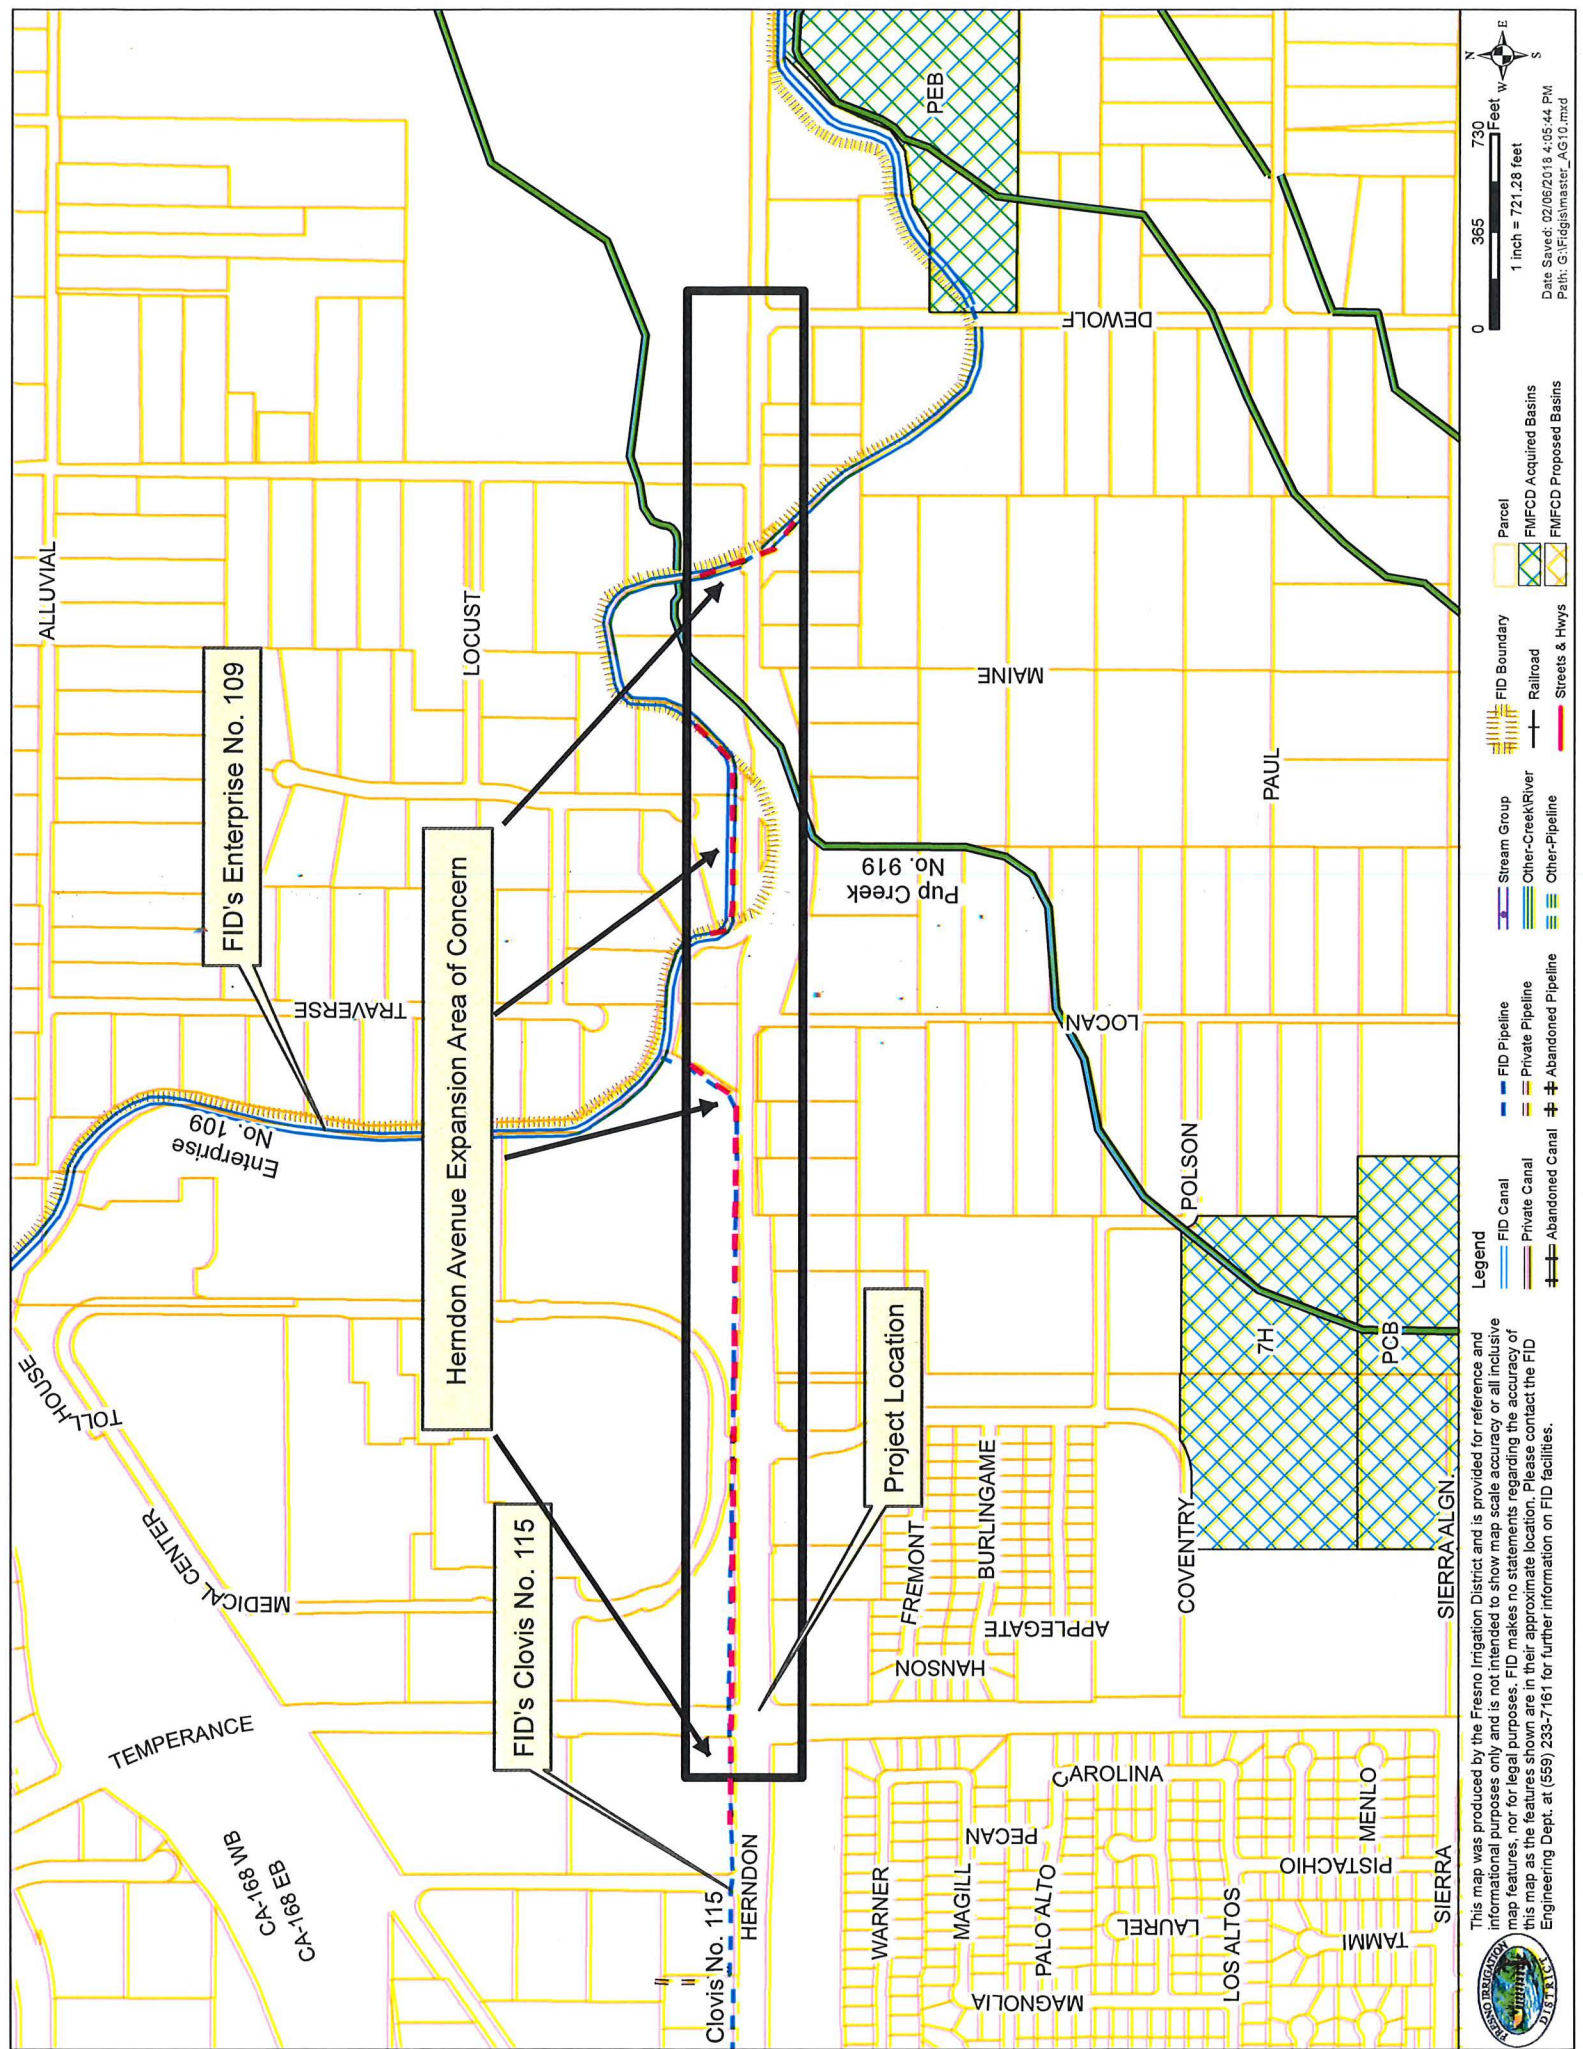

Thank you for submitting this for our review. We appreciate the opportunity to review and comment on the subject documents for the proposed project. If you have any questions, please feel free to contact Jeremy Landrith at (559) 233-7161 extension 7407 or [jlandrith@fresnoirrigation.com](mailto:jlandrith@fresnoirrigation.com).

Sincerely,

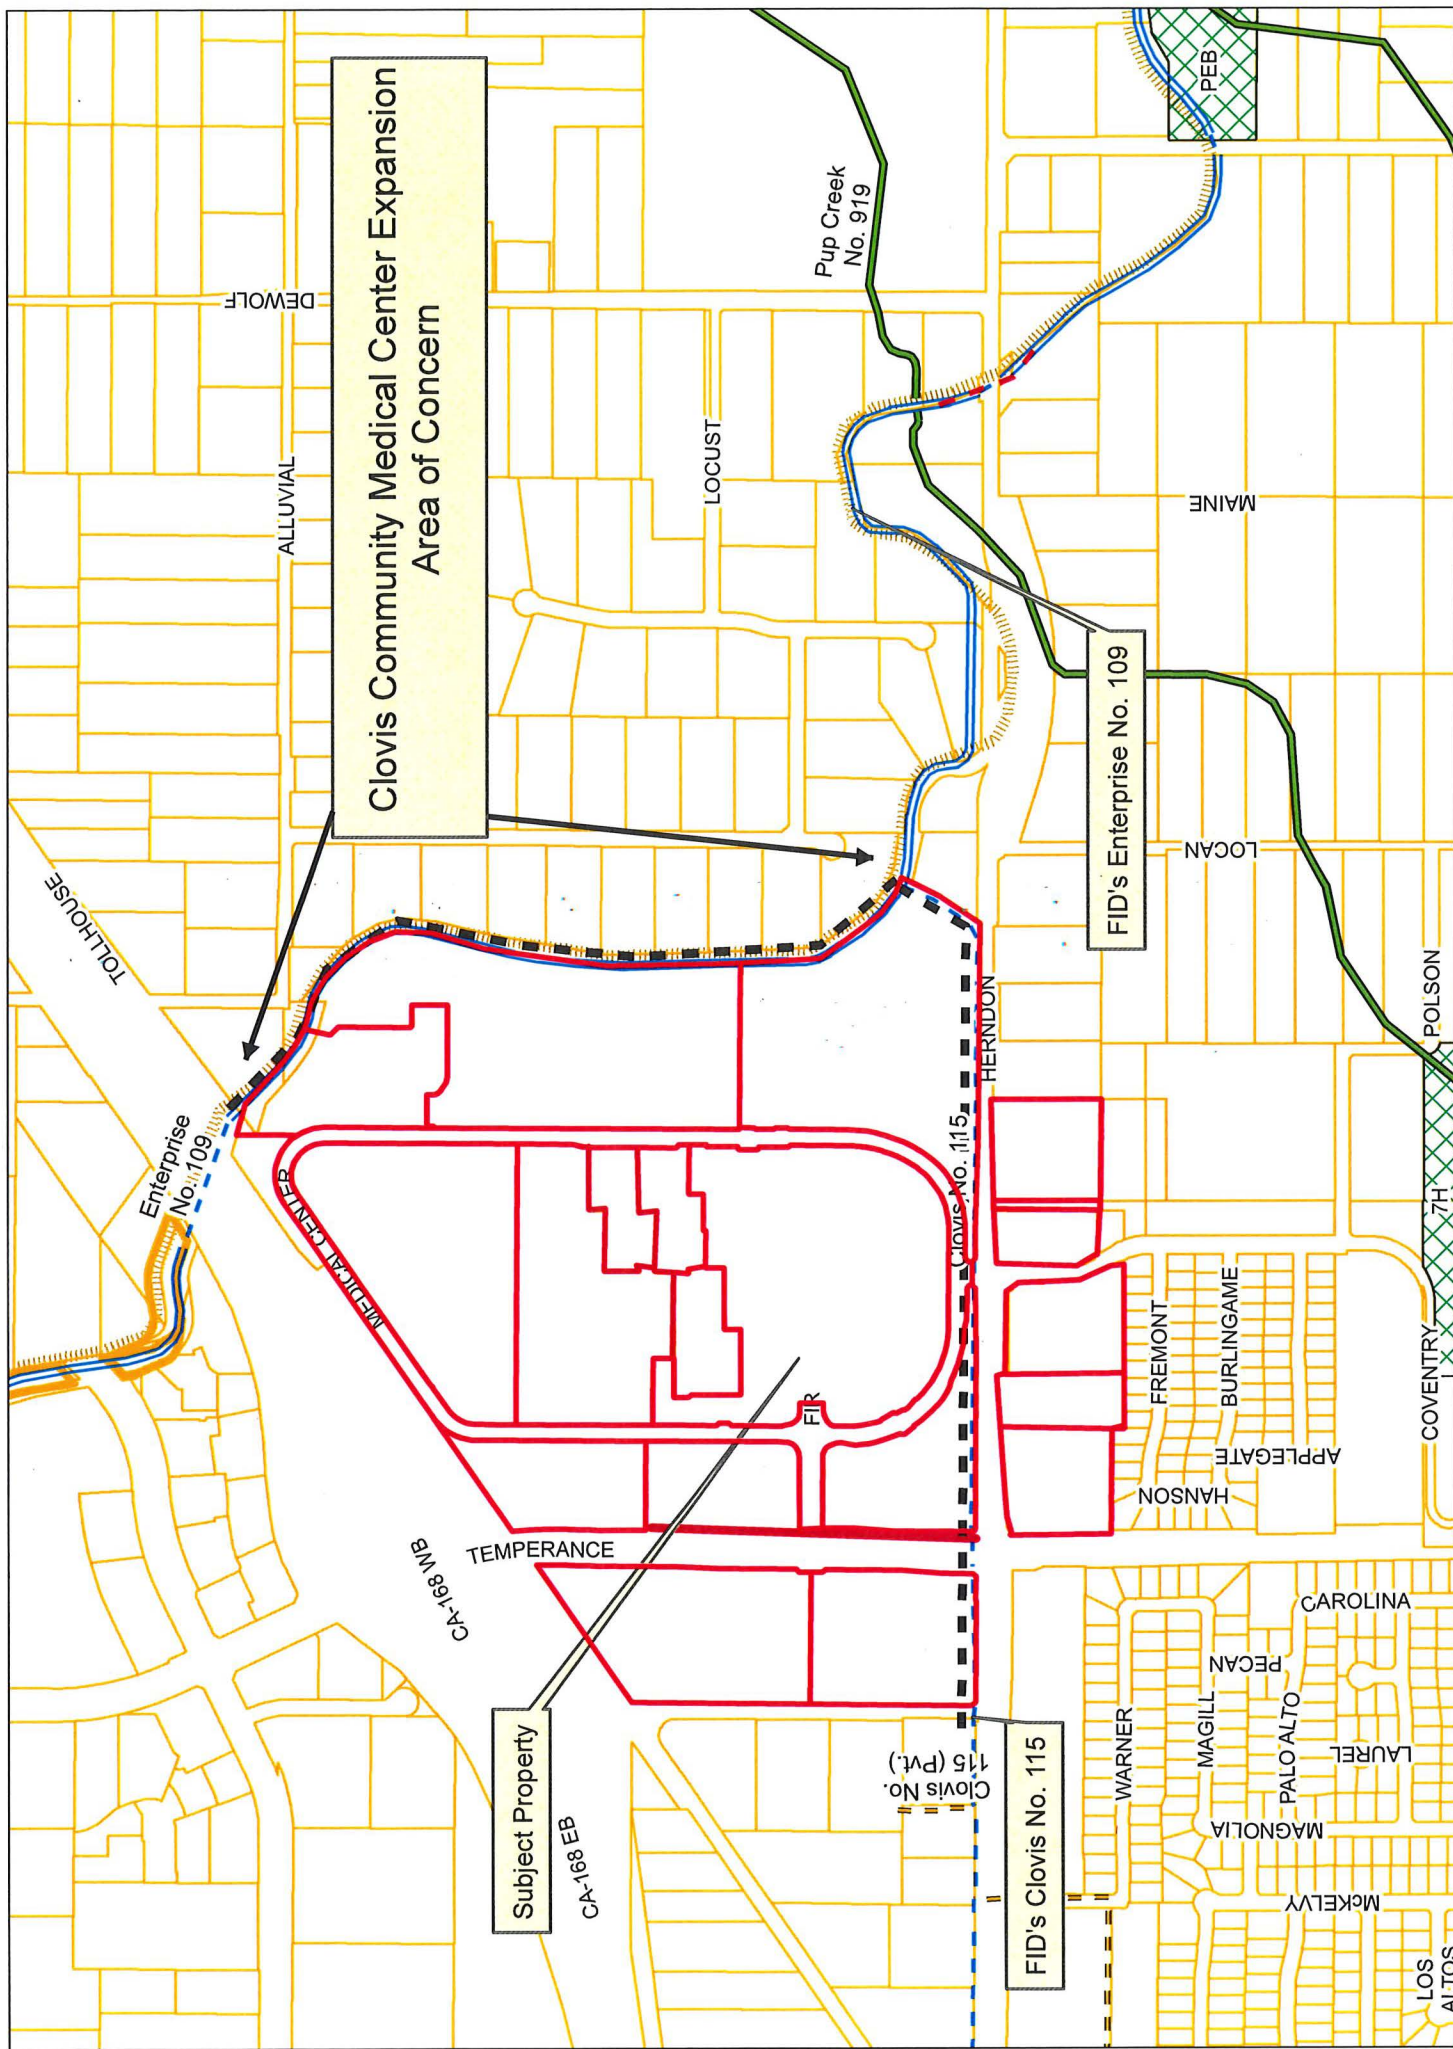

Laurence Kimura, P.E.  
Chief Engineer

This map was produced by the Fresno Irrigation District and is provided for reference and informational purposes only and is not intended to show map scale accuracy or all inclusive map features, nor for legal purposes. FID makes no statements regarding the accuracy of this map as the features shown are in their approximate location. Please contact the FID Engineering Dept. at (559) 233-7161 for further information on FID facilities.

SCALE: NOT TO SCALE

DATE: JANUARY 2018

STANDARD DETAIL

1-01

SHEET 1 OF 1

## **Response to Fresno Irrigation District (FID)**

### **Response 4-1**

The potential impacted facilities and FID's typical procedures and requirements related to development near such facilities are noted. The City and CCMC will comply with the existing policies, regulations and development standards of FID during the development process.

### **Response 4-2**

Informational comment noted and is correct.

### **Response 4-3**

The City recognizes that groundwater overdraft is an important issue and that the Kings Groundwater Sub-basin needs to ultimately reach sustainability. The Sustainable Groundwater Management Act (SGMA) was signed into law in 2014 to remedy unsustainable groundwater depletion in groundwater basins in California. SGMA requires the development and adoption of Groundwater Sustainability Plans (GSPs) by 2020 and that all high and medium priority groundwater basins must reach sustainability by 2040. This condition developed over a long period of time and it will take substantial time to rectify. As noted, the City of Clovis is a member of the North Kings Groundwater Sustainability Agency. This agency is responsible for developing a Groundwater Sustainability Plan (GSP). CCMC is already using recycled water from the City's wastewater treatment plant for landscape irrigation purposes, which constitutes a substantial portion of the CCMC's total water use. The City has been continually expanding its recycled water system. The City has diversified its water system over time to utilize surface water and recycled water while proportionately decreasing groundwater usage. The City and FMFCD have substantial groundwater recharge facilities that percolate surface water and stormwater into the ground. As a member of the North Kings Groundwater Sustainability Agency, the City is committed to working towards sustainability in the Kings Groundwater Sub-basin in accordance with SGMA.

### **Response 4-4**

The requested change to page 2-7 to the Draft EIR under Responsible Agencies has been made (see Chapter 4 of this Final EIR).

### **Response 4-5**

The requested change to page 12-1 to the Draft EIR under Hydrologic Setting has been made (see Chapter 4 of this Final EIR).

### **Response 4-6**

The Draft EIR does not have a page 4.15-32 nor does it have an "Irrigation Systems Integration" subsection. However, the existing requirements of the City of Clovis Municipal Code and FID indicated in the comment are noted.

**Response 4-7**

The existing regulations prohibiting any discharges into the canal are noted. All new and existing discharges and runoff will be routed to FMFCD storm drain facilities.

**Response 4-8**

The comment regarding FID water allocated to agricultural land and conversion to City water rates per agreement between the City and FID is noted.

**Response 4-9**

Please refer to Response 4-3.

**Response 4-10**

Please refer to Response 4-3.

**Response 4-11**

General comment on the need to make road improvements in a manner that allows FID to maintain and operate its facilities is noted.

**Response 4-12**

The City recognizes the constraints posed by the location of the Enterprise Canal, which runs parallel and adjacent to the north side of Herndon, east of Locan Avenue, for approximately 750 feet. The City has already anticipated in its preliminary design that the Herndon widening and related improvements would be shifted to the south in this area. One of the stated objectives for the Herndon Avenue Widening project (Draft EIR page 2-9) is to “minimize or avoid any encroachment or impact to the Enterprise Canal.” All rights-of-way and easements ultimately needed in relation to this section of the Enterprise Canal will be obtained with the implementation of this project.

**Response 4-13**

There are no parks or recreational facilities planned as part of this project. The City’s Parks and Recreation master plan does provide for a future trail to be located along the Enterprise Canal. The City is appreciative of FID’s support for the City’s trail planning, but the City recognizes that there are a number of issues of concern to FID, including public safety and liability concerns, minimizing the impact to FID’s ability to maintain and operate its canal facilities, right-of-way/property issues, and conflicts with FID above ground structures. The City looks forward to continuing to work with FID to resolve any issues and concerns such that successful trail planning and construction continues for the benefit of the community.

**Response 4-14**

The City acknowledges the various existing requirements, policies and procedures applicable to the development process reflected in the general comments, such as drive approach requirements, showing

easements on maps, review and approval of improvements plans, prohibition of utilities and fences/walls within the FID right-of-way, notification of construction activities affecting FID facilities, costs associated with FID plan review and the potential for other comments and requests by FID as more project detail becomes available. The City will work with FID as development takes place to be sure that existing regulations, policies and procedures are adhered to.

**Comment Letter 5***Making Conservation a  
California way of life.*

April 5, 2018

FRE-168-9.147

Clovis Community Medical Center Expansion/  
Herndon Avenue Widening  
SCH# 2016101005Mr. Bryan Araki  
City Planner  
City of Clovis  
1033 Fifth Street  
Clovis, California 93612

Dear Mr. Araki:

Thank you for including the California Department of Transportation (Caltrans) in the review process for continuation with the expansion of Clovis Community Medical Center per its Master Plan. The work would also include the widening of Herndon Avenue in the proximity of the Medical Center. The existing Medical Center is located on the northeast corner of the intersection of N. Temperance Avenue and E. Herndon Avenue, near State Route (SR) 168. The expansion would be phased over a 20 year period, and would include new inpatient bed towers, medical office buildings, a general support building, a cancer center, and a central plant and parking garage. The existing emergency department, surgical facilities, materials management, and outpatient community center would be expanded. The master plan also includes development of commercial buildings, a hotel, and an assisted living center across the street (N. Temperance Avenue and E. Herndon Avenue) from the main hospital campus. Caltrans provides the following comments:

Traffic Operations - N. Temperance Avenue

1. Caltrans recommends the addition of a right-turn lane (575 feet) from the SR168 eastbound off-ramp to southbound N. Temperance Avenue (E/B off-ramp) as an opening-day improvement. This ramp-intersection currently experiences some unstable flow during the morning peak travel periods, and the analysis worksheets show that this specific right-turn movement experiences considerable delay during both AM and PM peak travel periods. The first phase of the expansion would likely increase the volume of this specific turning movement by 45% during the morning peak travel period, and by 27% during the evening peak travel period (TIS Fig. 2, 4, 5). The second phase of the expansion would likely increase the volume of this specific turning movement by an additional 54% during the morning peak travel period, and by an additional 20% during the evening peak travel period (TIS Fig. 2, 10). Therefore, the proposed expansion project should construct the eastbound right-turn lane prior to opening-day.

**5-1**

- 5-2
2. The addition of a southbound lane on N. Temperance Avenue between the SR 168 E/B off-ramp and Fir Avenue is recommended. Intersections 4 and 5 (TIS Fig. 2, 7) show an increase in volume along this segment sufficient to substantiate the need for a third southbound lane. The first phase of the expansion would likely increase the volume along this southbound segment by 35% during the morning peak travel period, and by 24% during the evening peak travel period (TIS Fig. 2, 4). The second phase of the expansion would likely increase the volume along this southbound segment by an additional 41% during the morning peak travel period, and by an additional 19% during the evening peak travel period. Compared to the percentages of the impacts from other sources, the impact of the proposed expansion is substantial. Having a third receiving lane would be the preferred configuration with the addition of a second right-turn lane from the SR 168 E/B off-ramp.
- 5-3
3. Caltrans concurs with the traffic study's recommendation that an additional left-turn lane from the SR 168 E/B off-ramp is needed however, traffic generated from the proposed expansion does not impact this specific movement. Caltrans also concurs with the recommendation that a third northbound lane is needed on N. Temperance Avenue between the SR 168 E/B off-ramp and Fir Avenue. However, the operation along this northbound segment of N. Temperance Avenue does not affect the operation of the ramp intersection, so it falls upon the City to determine the priority and mechanism for such improvement.
- 5-4
4. The establishment of a New Access Road, proposed on northbound N. Temperance Avenue between the SR 168 E/B off-ramp and Fir Avenue would not affect the operation of the ramp. It is Caltrans' understanding that this New Access Road would be situated approximately mid-way between the ramp intersection and Fir Avenue, and would have only right-in and right-out access.
- 5-5
5. An encroachment permit must be obtained for all proposed activities for placement of encroachments within, under or over the State highway rights-of-way. Activity and work planned in the State right-of-way shall be performed to State standards and specifications, at no cost to the State. Engineering plans, calculations, specifications, and reports (documents) shall be stamped and signed by a licensed Engineer or Architect. Engineering documents for encroachment permit activity and work in the State right-of-way may be submitted using English Units. The Permit Department and the Environmental Planning Branch will review and approve the activity and work in the State right-of-way before an encroachment permit is issued. The Streets and Highways Code Section 670 provides Caltrans discretionary approval authority for projects that encroach on the State Highway System. Encroachment permits will be issued in accordance with Streets and Highway Codes, Section 671.5, "Time Limitations." Only the legal property owner or his/her authorized agent can pursue obtaining an encroachment permit. Please call the Caltrans Encroachment Permit Office - District 6: 1352 W. Olive, Fresno, CA 93778, at (559) 488-4058.

#### Sustainability

- 5-6
6. Caltrans recommends the project provide charging stations for electric vehicles as part of the statewide effort to reduce greenhouse gas emissions. Other environmental considerations include the use of solar or alternative energies; strategic placement of windows; heating water utilizing sunlight, to supplement or reduce the significant energy demands of a facility of this size.

Mr. Bryan Araki

April 5, 2018

Page 3

5-7

7. Caltrans recommends green paint be applied to the roadway in locations of potential conflict between motorists and bicyclists—particularly the SR 168 interchange at N. Temperance Avenue. There are class II bike lanes north and south of the interchange and it is anticipated that bike travel may increase with the development of the Health Science Center to the north. Caltrans reminds the developer that bike parking should be provided on site in accordance with the City of Clovis' Active Transportation Plan.

Please be advised these recommendations were arrived at subsequent to planning-level analysis. Additional requirements may arise during the permit process as a result of field review. Questions about these comments can be directed to Jamaica Gentry at (559) 488-7307.

Sincerely,

MICHAEL NAVARRO

Branch Chief

Transportation Planning - North

## **Response to State of California, Department of Transportation (Caltrans)**

### **Response 5-1**

The eastbound right turn lane from SR 168 eastbound off-ramp to southbound Temperance Avenue is part of a City fee that is proposed to take effect this year. Instead of construction, the project will participate in the fee program.

### **Response 5-2**

Addition of a third lane with a Class II bike lane would require modifications to the Temperance curb alignments. The City's Active Transportation Plan requires a Class II bike lane on the north and south directions of Temperance Avenue, thus this would be the currently required improvement. Another option, which would not require modifications to the curb alignments, would be to restripe Temperance to provide three lanes and provide a Class I bike lane. This option, however, would require modification of the Active Transportation Plan.

### **Response 5-3**

The comment reflects that Caltrans concurs with the findings of the Traffic Study while adding minor clarifications as to the scope of effects on State roadways. No additional response is required.

### **Response 5-4**

The comment regarding establishment of a New Access Road in relation to the SR 168 E/B off-ramp is noted. No additional response is required.

### **Response 5-5**

This comment identifies Caltrans' encroachment permit requirements for activities within, over, or under the State highway right-of-way. It is acknowledged that development of the project will require adherence to these requirements.

### **Response 5-6**

As indicated on page 8-5 in Chapter 8 (Energy), the majority of the mitigation measures included to address impacts to Air Quality and Greenhouse Gas Emissions (Chapters 5 and 10, respectively) entail energy-efficient and/or energy reducing qualities. These measures include: utilizing green building materials in construction of facilities; utilizing drought-resistant shade trees to reduce sun exposure of buildings and parking areas; installing high-efficiency heating and cooling systems; utilizing high-efficiency gas or solar water heaters; utilizing built-in energy-efficient appliances (i.e., Energy Star rated); utilizing double- or triple-paned windows; utilizing energy-efficient interior lighting; utilizing low-energy street lights (i.e., sodium, light-emitting diode [LED]); and installing energy-saving systems in rooms that reduce energy usage associated with HVAC systems and appliances when rooms are not occupied, except where such systems would pose a safety or health concern. The project is also generally subject to the California Green Building Standards Code (Title 24, Part 11) and the California Energy Code (Title 24, Part 6 – with some exceptions for acute care medical facilities

included in the proposal). The standards collectively include additional requirements to improve the energy efficiency of buildings, including more efficient windows, insulation, lighting, ventilation systems and numerous other improvements. The City will encourage CCMC to provide charging stations for electric vehicles.

The City of Clovis will consider applying green paint in locations of potential conflict between motorists and bicyclists. CCMC will provide bike parking in accordance with the City of Clovis' Active Transportation Plan.

**Re: Comments on DEIR for Clovis Community Medical Center Expansion and  
Herndon Avenue Widening Project**

Dear Mr. Araki:

This letter presents the comments of my client, Suburban Propane, L.P., regarding the February 2018 Draft Environmental Impact Report ("DEIR") prepared for the Clovis Community Medical Center Expansion and Herndon Avenue Widening Project, pursuant to the California Environmental Quality Act ("CEQA").

The DEIR states that the Clovis Community Medical Center ("CCMC") proposes to expand its healthcare facilities on the CCMC campus located east of Temperance Avenue, between Herndon Avenue and State Route 168. In addition, the project proposes development on land owned by CCMC west of Temperance Avenue and on land south of Herndon Avenue. The project is split into two phases, a 2-10 year expansion plan, and a 20 year expansion plan. The area adjacent to Suburban Propane's storage tank is proposed to include 150,000 square feet of commercial uses and a 150-room hotel within the next 2 to 10 years. (See DEIR pp. 2-4, 2-5 and Table 2.2.)

Suburban Propane has a 30,000-gallon above-ground propane storage tank located off of Tollhouse Road, just west of Temperance Avenue. (See the attachment to this letter, which shows the location of the propane tank on DEIR Figure 3.2.) This storage tank has been in use at this location since June 13, 1998. Under the proposed project, the open field adjacent to the east side of the storage tank would be developed for commercial purposes and a hotel.

{00033844;1 }

6-2

The effect of the proximity of the proposed project to Suburban Propane's existing storage tank is not examined at all in the DEIR. Suburban Propane seeks to alert the Clovis Planning Department, Planning Commission, and City Council to the existence of Suburban Propane's storage tank now, in order to avoid being asked to relocate the storage tank in the future.

We do not believe that proposing a hotel and commercial uses adjacent to Suburban Propane's existing storage tank constitutes appropriate land use planning. In addition, the proposed project could have an impact on Suburban Propane's tank use, which tank provides a utility service to the public. Despite that, Chapter 21 of the DEIR fails to acknowledge Suburban Propane's storage tank facility and potential related impacts to it. We also note that DEIR chapters 20 and 21 are both paginated starting with page 21-1. Please revise the DEIR to address these concerns.

6-3

There may be additional concerns with the DEIR, which Suburban Propane will address if necessary.

Please contact me or Sarah Taylor at 916-462-8888 if you have any questions.

Sincerely yours,

MITCHELL CHADWICK LLP

Patrick G. Mitchell

cc: Susan Delia (Suburban Propane)  
Sarah Taylor (Mitchell Chadwick)

Figure 3.2 –Herndon Avenue Widening Area Photos

### Project Area

Clovis Community Medical Center Expansion and Herndon Avenue Widening Project  
City of Clovis

ODELL Planning & Research, Inc.

## **Response to Mitchell Chadwick/Suburban Propane**

### **Response 6-1**

These paragraphs include introductory information about the purpose of the letter; a restatement of information from the Draft EIR project description; information on the size of the propane tank (30,000 gallons) and how long it has been in place (June 13, 1998); and indicates that the area west of Temperance Avenue proposed for retail use and a hotel is adjacent to Suburban Propane's storage tank.

### **Response 6-2**

The comment letter notes the proximity of the of the project to the existing tank and does "not believe that proposing a hotel and commercial uses adjacent to Suburban Propane's existing storage tank constitutes appropriate land use planning." In response to this statement, City of Clovis provides the following:

The comment letter indicates that the propane tank has been in use at that location since 1998. The City notes that the land to the east proposed for commercial and hotel use has been designated for commercial use (business corridor) in the Herndon-Shepherd Specific Plan since 1988 and in the City of Clovis General Plan since 1993. Thus, a designation for commercial land use existed prior to the approval and installation of the propane tank.

The comment letter does not provide any information or analysis that demonstrates the tank will pose a significant hazard to future commercial use to the east. National Fire Protection Association *Liquefied Petroleum Gas Code* (NFPA 58) requires that propane storage tanks containing 2,001- 30,000 gallons must be located no less than 50 feet from the property line. The tank is located approximately 54 feet from the west property line of the 0.52-acre propane tank parcel and approximately 170 feet from the east property line. The nearest point of the CCMC commercial property is 280 feet east of the propane tank. The CCMC property is 495 feet wide so most of the commercial uses would likely be substantially further than 280 feet from the propane tank.

It is noted that existing residences are located 185 feet southwest, 230 feet west and 280 feet southeast of the propane tank. These homes all existed when the tank was installed in 1998.

Lastly, it is unclear how the project would have an impact on Suburban Propane's tank use. No information is provided to support this contention.

### **Response 6-3**

The comment indicates there may be additional concerns with the Draft EIR but does not provide any further elaboration as to the character or nature of those concerns.

FRESNO METROPOLITAN FLOOD CONTROL DISTRICT

File 170.11  
310. "7H"  
550.30 "7H"

Comment Letter 7

April 11, 2018

Mr. Bryan Araki  
City of Clovis  
1033 Fifth Street  
Clovis, CA 93612

Dear Mr. Araki,

**Fresno Metropolitan Flood Control District Comments for  
Notice of Availability of a Draft Environmental Impact Report for  
Clovis Community Medical Center Expansion and  
Herndon Avenue Widening Project  
Drainage Area "7H"**

The Fresno Metropolitan Flood Control District (FMFCD) has reviewed the subject Draft Environmental Impact Report (DEIR) and requests the following revisions:

- 7-1 1. Page 12-1, Hydrologic Setting section, paragraph 2, the DEIR incorrectly states that the Enterprise Canal is maintained by the Fresno Metropolitan Flood Control District. The canal is maintained by the Fresno Irrigation District.
- 7-2 2. The DEIR should address the major storm requirements included on page 2, paragraph 3 of the FMFCD's letter to the City of Clovis dated November 7, 2016. Major storm flows from areas east of Temperance Avenue have historically flowed across the westerly portion of the proposed expansion site and then over to Magnolia Avenue (old Temperance Avenue). The westerly portion of the expansion shall be graded to maintain the historical major storm path.
- 7-3 3. Page 12-6, HY-3 section, paragraph 2, the DEIR states facilities are adequate to serve CCMC's existing stormwater needs and the additional stormwater runoff created as a result of the expansion plan. This statement is partially correct. CCMC's existing facilities have adequate service, but stormwater runoff from a portion of the expansion project, specifically APN's 553-020-34, 40, 42, 53, 70, 71, 72, and 73, may exceed the existing pipeline capacity and require mitigation. Please reference FMFCD's letter to the City of Clovis dated November 7, 2016.

For your reference we have enclosed a copy of our November 7, 2016 response letter to the Notice of Preparation issued by the City of Clovis for this project.

## FRESNO METROPOLITAN FLOOD CONTROL DISTRICT

*Capturing stormwater since 1956.*

File 170.11

310. "7H"

550.30 "7H"

November 7, 2016

Mr. Bryan Araki  
City of Clovis  
1033 Fifth Street  
Clovis, CA 93612

Dear Mr. Araki,

**Fresno Metropolitan Flood Control District Comments for  
Notice of Preparation of a Draft Environmental Impact Report for  
Clovis Community Medical Center Expansion and  
Herndon Avenue Widening Project  
Drainage Area "7H"**

The Fresno Metropolitan Flood Control District (FMFCD) bears responsibility for storm water management within the Fresno-Clovis metropolitan area, including the area of the proposed project site. Within the metropolitan area, storm runoff produced by land development is to be controlled through a system of pipelines and storm drainage retention basins. The community has developed and adopted a Storm Drainage and Flood Control Master Plan. Each property contributes its pro-rata share to the cost of the public drainage system. All properties are required to participate in the community system for everyone. It is this form of participation in the cost and/or construction of the drainage system that will mitigate the impact of development.

The subject property shall pay drainage fees pursuant to the Drainage Fee Ordinance prior to approval of any final maps and/or issuance of building permits at the rates in effect at the time of such approval. Please contact FMFCD for a final fee obligation prior to issuance of any construction permits. Should land use densities of existing residential areas be increased, the property would be subject to a reassessment of drainage fees based on the proposed increased land uses and may include the requirement of additional drainage fees to be paid to offset the increased land use. Each proposed development will be reviewed and assessed upon submittal to FMFCD. Any drainage fees previously paid on a property would be given a credit against any new fee responsibility.

k:\letters\environmental impact report letters\deir ccmc expansion- herndon widening.docx

**Mr. Bryan Araki**  
**Notice of Preparation of a Draft Environmental Impact Report for**  
**Clovis Community Medical Center Expansion and**  
**Herndon Avenue Widening Project**  
**November 7, 2016**  
**Page 2**

There are existing storm drain facilities located throughout the plan area. Any proposed relocation, construction of proposed or reconstruction of existing storm drainage facilities will need to be reviewed and approved by FMFCD prior to implementation. Any storm drainage facilities that are not located within the public street right-of way shall be within a dedicated pipeline easement to FMFCD. No encroachments into the easement shall be permitted including, but not limited to, foundations, roof overhangs, swimming pools, and trees.

Much of the FMFCD Master Plan storm drainage system for the plan area is complete. This system was designed for land use densities designated on prior General Plans and have been reflected in the Master Plan. Any proposed densification of existing residential areas within the plan area may exceed the capacity of the existing storm drainage system and will require FMFCD review and approval prior to implementation. Mitigation of site storm water discharge may be required in some circumstances. Such mitigation shall be in the form of on-site retention or FMFCD system modifications. All mitigation shall be reviewed and approved by FMFCD.

The grading of any proposed development within the plan areas including public street areas shall be consistent with the FMFCD Master Plan. Additionally, grading shall not have an adverse impact to major storm conveyance, and to the passage of storm water to the adjacent roadways and existing storm drainage pipelines and inlets. Development shall provide the appropriate surface flowage easements or covenants for any portion of the development area that cannot convey storm water to the public right-of-way without crossing private property.

Any proposed new structures within the plan area with street level entry may be at risk for flooding during a large storm event. Therefore, any new development within the plan area is required to provide street capacity calculations and/or check the overflow point to determine the finish floor that provides protection of the structure from flooding during a large storm event.

Clovis Community Medical Center shall excavate the District's Basin "7H" as needed to provide storage for the additional runoff generated from the project area.

FMFCD will need to review and approve the final improvement plans for all development (i.e. grading, street improvement and storm drain facilities) within the boundaries of the proposed project to insure consistency with the approved Storm Drainage Master Plan.

**Mr. Bryan Araki**

**Notice of Preparation of a Draft Environmental Impact Report for  
Clovis Community Medical Center Expansion and  
Herndon Avenue Widening Project**

**November 7, 2016**

**Page 3**

If there are to be storm water discharges from private facilities to the FMFCD's storm drainage system, they shall consist only of storm water runoff and shall be free of solids and debris. Landscape and/or area drains are not allowed to connect directly to FMFCD's facilities.

In an effort to improve storm runoff quality, outdoor storage areas shall be constructed and maintained such that material that may generate contaminants will be prevented from contact with rainfall and runoff and thereby prevent the conveyance of contaminants in runoff into the storm drain system.

FMFCD encourages, but does not require that roof drains from non-residential development be constructed such that they are directed onto and through a landscaped grassy swale area to filter out pollutants from roof runoff.

Runoff from areas where industrial activities, product, or merchandise come into contact with and may contaminate storm water must be directed through landscaped areas or otherwise treated before discharging it off-site or into a storm drain. Roofs covering such areas are recommended. Cleaning of such areas by sweeping instead of washing is to be required unless such wash water can be directed to the sanitary sewer system. Storm drains receiving untreated runoff from such areas that directly connect to FMFCD's system will not be permitted. Loading docks, depressed areas, and areas servicing or fueling vehicles are specifically subject to these requirements. FMFCD's policy governing said industrial site NPDES program requirements are available. Contact FMFCD's Environmental Department for further information regarding these policies related to industrial site requirements.

Thank you for the opportunity to comment. Please keep our office informed on the development of these plans. If you should have any questions or comments, please contact FMFCD at (559) 456-3292.

Very truly yours,

**Robert Villalobos  
Engineering Technician III**

RV/lrl

## **Response to Fresno Metropolitan Flood Control District (FMFCD)**

### **Response 7-1**

The comment correctly notes that the Enterprise Canal is owned, operated, and maintained by the Fresno Irrigation District (FID) rather than FMFCD. This correction has been made and is reflected in Chapter 5 of this Final EIR.

### **Response 7-2**

FMFCD's comments regarding the historic grading pattern in the western area of the project site are noted. The detailed project development plans, when proposed, will require subsequent review by FMFCD and will be required conform to FMFCD requirements, including grading to maintain the historical major storm path.

### **Response 7-3**

FMFCD's comments regarding existing pipeline capacity in a small portion of the proposed project area (southeast corner of Herndon and Coventry Avenues) are noted. FMFCD should be aware that APNs 553-020-34, 40, 42 and 53 are part of the existing Cedarwood Elementary School campus and not part of the project site. These parcels comprise the northern portion of the elementary school turfed play fields, and therefore would not generate a large amount of runoff compared to more intense urban uses. In any event, the project development plans, when proposed, will require subsequent review by FMFCD and will be required conform to FMFCD requirements.

April 19, 2018

Comment Letter 8

Bryan Araki  
City of Clovis  
Planning & Development Services  
1033 Fifth Street  
Clovis, CA 93612

**Project: Draft Environmental Impact Report for the Clovis Community Medical Center Expansion and Herndon Avenue Widening Project**

**District CEQA Reference No: 20180180**

Dear Mr. Araki:

The San Joaquin Valley Unified Air Pollution Control District (District) has reviewed the Notice of Preparation (NOP) for the Clovis Community Medical Center Expansion and Herndon Avenue Widening Project. The proposed project consists of an expansion to the existing Clovis Community Medical Center and road widening on Herndon Avenue. The Clovis Community Medical Center Expansion includes two major phases: a 2–10 year expansion plan and a 20 year expansion plan. The 2–10 year expansion plan would add 410,172 square feet to the existing Clovis Community Medical Center. The 2–10 year plan also includes up to 150,000 square feet of commercial space and a 150 room hotel. The 20 year expansion plan would add 413,769 square feet to the existing Clovis Community Medical Center. The 20 year plan also includes up to 70,000 square feet of retail and/or office space and a 100 unit assisted living or memory care facility. The project would also widen the current five lanes on Herndon Avenue between Temperance and Coventry Avenues to six lanes and widen the roadway between Coventry and the southern leg of DeWolf Avenue from two lanes to a four lane divided roadway. The District offers the following comments:

### **1. Voluntary Emissions Reduction Agreement (VERA)**

For Mitigation Measure AQ-2, the Draft EIR indicates that Clovis Community Medical Center, (the project proponent) will enter into a VERA with the District. On Page 20, the Draft EIR Appendices Mitigation Measure AQ-2 states, "... *The VERA shall be reviewed and approved by the SJVAPCD prior to issuance of construction/grading permits by the City of Clovis. The project proponent/owner shall submit to the City of Clovis Planning Department documentation confirming compliance with the VERA, prior to issuance of final discretionary approval (e.g., approval of the grading permit)....*"

**Sayed Sadredin**

Executive Director/Air Pollution Control Officer

**Northern Region**  
4800 Enterprise Way  
Modesto, CA 95356-8718  
Tel: (209) 557-6400 FAX: (209) 557-6475

**Central Region (Main Office)**  
1990 E. Gettysburg Avenue  
Fresno, CA 93726-0244  
Tel: (559) 230-6000 FAX: (559) 230-6061

**Southern Region**  
34946 Flyover Court  
Bakersfield, CA 93308-9725  
Tel: 661-392-5500 FAX: 661-392-5585

Based on project information and the intent of the project mitigation, the VERA is to be approved by the District prior to the City's issuance of construction/grading permits. This is consistent with the requirements of a VERA to have mitigation in place prior to the start of the first activity generating emissions, including but not limited to demolition, grading, etc., whichever occurs first. This will ensure that the targeted emissions reductions and the project emissions occur contemporaneously.

8-1 Additionally, the VERA will include requirements for the District, upon successful fulfillment of mitigation under the VERA of project-related emissions, to verify in writing to the project proponent and to the City of Clovis that the project related impacts on air quality have been mitigated as required under the VERA. This process, which includes the funding of clean emission reduction projects, will occur over an extended period of time, however contemporaneous with the project. As such, the following changes are recommended (see ~~strikeout~~ and underline):

*"The VERA shall be reviewed and approved by the SJVAPCD prior to issuance of construction/grading permits by the City of Clovis. The project proponent/owner shall submit to the City of Clovis Planning Department documentation confirming ~~compliance with~~ entering into the VERA, prior to issuance of final discretionary approval (e.g., approval of the grading permit)."*

## 2. District Rule 9510 Indirect Source Review (ISR)

District Rule 9510 is intended to reduce a project's impact on air quality through project design elements or by payment of applicable off-site mitigation fees. Any applicant subject to District Rule 9510 is required to submit an AIA application to the District no later than applying for final discretionary approval.

8-2 Based on information provided to the District, the proposed Project would equal or exceed 20,000 square feet of medical offices. Therefore, the District concludes that the proposed Project is subject to District Rule 9510, which requires that an AIA application be submitted at this time.

The District recommends that demonstration of compliance with District Rule 9510 be made a condition of project approval. Information about how to comply with District Rule 9510 can be found online at: <http://www.valleyair.org/ISR/ISRHome.htm>.

## 3. Other District Permits/Rules

8-3 The project may be subject to District Rules and Regulations, including: Regulation VIII (Fugitive PM10 Prohibitions), Rule 4102 (Nuisance), Rule 4601 (Architectural Coatings), Rule 4641 (Cutback, Slow Cure, and Emulsified Asphalt, Paving, and Maintenance Operations). In the event an existing building will be renovated, partially demolished or removed, the project may be subject to District Rule 4002 (National Emission Standards for Hazardous Air Pollutants). The above list of rules is neither exhaustive nor exclusive. To identify other District rules or regulations that apply to this project or to obtain information about District permit requirements, the applicant is

8-3

strongly encouraged to contact the District's Small Business Assistance Office at (559) 230-5888. Current District rules can be found online at: [www.valleyair.org/rules/1ruleslist.htm](http://www.valleyair.org/rules/1ruleslist.htm).

District staff is available to meet with you and/or the applicant to further discuss the regulatory requirements that are associated with this project. If you have any questions or require further information, please call Michael Corder at (559) 230-5818.

Sincerely,

Arnaud Marjollet  
Director of Permit Services

A handwritten signature in blue ink, appearing to read "B. Clements", is written over the printed name.

Brian Clements  
Program Manager

AM:mc

## Response to San Joaquin Valley Air Pollution Control District (SJVAPCD)

### Response 8-1

SJVAPCD's comments regarding the timing of approval for a VERA and requirements for written verification by the District upon successful fulfillment of mitigation are noted. Mitigation Measure AQ 1.2 has been updated to provide improved clarity and detail regarding the VERA, given that this is a Program EIR that covers a phased long-term project. The updated language includes the change recommended in SJVAPCD's comment letter (i.e. changing "compliance with" to "entering into").

**AQ 1.2:** A Voluntary Emissions Reduction Agreement (VERA) shall be entered into with the SJVAPCD to reduce operational emissions of ROG and NOX to less than 10 tons/year and emissions of PM10 to below 15 tons/year. Operational emissions of ROG, NOX and PM10 (inclusive of PM2.5) shall be reduced in excess of the reductions required per compliance with SJVAPCD's ISR Rule (Refer to Mitigation Measure AQ-1). Emission reductions may be achieved by use of newer, low-emission equipment, implementation of on-site or off-site mitigation, and/or the funding of off-site mitigation, through participation in the SJVAPCD's off-site mitigation program. The project development plans are long term and conceptual in nature and subject to change in uses and extent otherwise allowed by City zoning that have lesser or equal impacts to those assessed in the EIR. VERA emission estimates shall be based on project-specific modeling assumptions where available (e.g., truck trip generation). Modeling performed shall account for declining emissions during the 10-year mitigation period due to vehicle turnover projected by the latest State approved emission models. VERA emission estimates may be revised to reflect actual development plans proposed for the site at the time each building or phase is finalized. VERA mitigation fee payments for a building or phase may be deferred until no later than 30 days prior to commencing construction activities for the building or phase. The VERA shall be reviewed and approved by the SJVAPCD prior to issuance of construction/grading permits by the City of Clovis. The project proponent/owner shall submit to the City of Clovis Planning Department documentation confirming ~~compliance with~~ entering into the VERA, prior to issuance of final discretionary approval (e.g., approval of the grading permit for the first construction project relying on this EIR). Development and implementation of the VERA shall be fully funded by the project proponent/owner as development progresses. With approval by SJVAPCD, the VERA may also be used to demonstrate compliance with emission reductions required by SJVAPCD's ISR Rule (Rule 9510).

### Response 8-2

SJVAPCD's comment regarding the applicability of District Rule 9510 (Indirect Source Review) is noted. Mitigation Measure AQ 1.1 requires that the project to comply with Rule 9510. Accordingly, an Air Impact Assessment (AIA) shall be prepared for the project, and the AIA shall be submitted to and approved by the SJVAPCD prior to issuance of construction/grading permits by the City of Clovis.

### Response 8-3

SJVAPCD's comment that additional District rules and regulations may apply to the project is noted. The project will comply with subsequent rules and regulations as such rules and regulations become applicable during the course of development of the project.

# CHAPTER 5

## Revisions to the Draft EIR

---

### INTRODUCTION

This chapter contains revisions to the Draft EIR resulting from comments received on the Draft EIR. Added text is underlined and deleted text is shown in ~~striketrough~~ type. The revisions consist of clarifications and amplifications to the existing document.

### DRAFT EIR REVISIONS

#### Chapter 2, Responsible Agencies, Page 2-7:

##### Responsible Agencies

Under CEQA, the following state and local agencies will be Responsible Agencies for the project. The agencies and discretionary approvals necessary from each are as follows:

- a. The California Office of Statewide Health Planning and Development must review and approve the construction plans and geotechnical reports for the CCMC expansion.
- b. The County of Fresno must review and approve the Herndon Avenue Widening project improvements within its jurisdiction.
- c. The Fresno Irrigation District requires that it review, approve and be made a party to signing all improvement plans which affect its property/easements and canal/pipeline facilities including, but not limited to sewer and water, FMFCD, street, landscaping, dry utilities and all other utilities. must review and approve any project improvements that may encroach upon or adversely affect the Enterprise Canal.
- d. The Fresno Metropolitan Flood Control District must review and approve any plans for storm drainage improvements or modifications.

#### Chapter 12, Second Paragraph under Hydrologic Settings, Page 12-1:

Notable surface water features in the vicinity of the project site include the Enterprise Canal, which forms the eastern boundary of the CCMC campus, and tributaries of Pup Creek. The Enterprise Canal is owned, operated and maintained by Fresno Irrigation District. ~~These surface water features are components of~~ The stormwater drainage system is maintained by the Fresno Metropolitan Flood Control District (FMFCD), and is discussed more below.

#### Chapter 1, Mitigation Measure AQ-1.2, Page 1-6 and Chapter 5, Mitigation Measure AQ-1.2, Page 5-21:

~~AQ-1.2: A Developer Mitigation Contract (DMC)~~ Voluntary Emission Reduction Agreement (VERA) shall be entered into with the SJVAPCD to reduce operational emissions of ROG and NOX to less than 10 tons/year and emissions of PM10 to below 15 tons/year. Operational emissions of ROG, NOX and PM10 (inclusive of PM2.5) shall be reduced in excess of the reductions required per compliance with SJVAPCD's ISR Rule (Refer to Mitigation Measure AQ-1). Emission reductions may be achieved by use of newer, low-emission equipment, implementation of on-site or off-site mitigation, and/or the funding of off-site mitigation, through participation in the SJVAPCD's off-site mitigation program. The project development plans are long term and conceptual in nature and subject to change in uses and extent otherwise allowed by City zoning that have lesser or equal impacts to those assessed in the

EIR. VERA emission estimates shall be based on project-specific modeling assumptions where available (e.g., truck trip generation). Modeling performed shall account for declining emissions during the 10-year mitigation period due to vehicle turnover projected by the latest State approved emission models. VERA emission estimates may be revised to reflect actual development plans proposed for the site at the time each building or phase is finalized. VERA mitigation fee payments for a building or phase may be deferred until no later than 30 days prior to commencing construction activities for the building or phase. The ~~DMC~~ VERA shall be reviewed and approved by the SJVAPCD prior to issuance of construction/grading permits by the City of Clovis. The project proponent/owner shall submit to the City of Clovis Planning Department documentation confirming ~~compliance with~~ entering into the ~~DMC~~ VERA prior to issuance of final discretionary approval (e.g., approval of the grading permit for the first construction project relying on this EIR). Development and implementation of the ~~DMC~~ VERA shall be fully funded by the project proponent/owner as development progresses. With approval by SJVAPCD, the ~~DMC~~ VERA may also be used to demonstrate compliance with emission reductions required by SJVAPCD's ISR Rule (Rule 9510).

**Draft CEQA Resolution**  
**Draft CUP85-18A11 Resolution**

**DRAFT  
RESOLUTION 18-\_\_**

**RESOLUTION OF THE PLANNING COMMISSION OF THE CITY OF CLOVIS  
RECOMMENDING THAT THE CITY COUNCIL: (1) CERTIFY THE CLOVIS  
COMMUNITY MEDICAL CENTER ENVIRONMENTAL IMPACT REPORT AND ADOPT  
A MITIGATION MONITORING/ REPORTING PROGRAM FOR THE CLOVIS MEDICAL  
CENTER EXPANSION AND HERNDON AVENUE WIDENING PROJECTS**

**WHEREAS**, the Project applicant is Clovis Community Medical Centers (“Applicant”); and

**WHEREAS**, the Applicant is proposing to undertake the Clovis Community Medical Center Expansion Project (“Project”), which consists of a ten-year expansion plan for additional facilities and improvements and a long range site development master plan for 20 years in the future; and

**WHEREAS**, the Clovis Medical Center Expansion Project consists of approximately 148 acres and is located on the north and south sides of Herndon Avenue and east and west sides of Temperance Avenue, in the City of Clovis, Fresno County, California; and

**WHEREAS**, the Herndon Avenue Widening Capital Investment Project is located on Herndon Avenue between Temperance and DeWolf Avenues, in the City of Clovis and County of Fresno; and

**WHEREAS**, the City caused to be prepared a Draft Program Environmental Impact Report (“Draft EIR”) for the Project in February 2018 to evaluate potentially significant adverse environmental impacts; and

**WHEREAS**, the Draft EIR was made available for public review and comment in conformance with CEQA and the State CEQA Guidelines; and

**WHEREAS**, written comments were received on the Draft EIR during its public review period; and

**WHEREAS**, the City caused to be prepared a Final Program Environmental Impact Report (“Final EIR”) for the Project in May 2018, which contains the written comments upon the Draft EIR and responses thereto, as well as changes and additions to the Draft EIR text; and

**WHEREAS**, the Draft EIR and the Final EIR collectively make up the Environmental Impact Report (the “EIR”) for the Project; and

**WHEREAS**, the EIR was prepared, circulated, and made available for public comment pursuant to the California Environmental Quality Act (“CEQA”), Public Resources Code, Sections 21000 et seq., and the Guidelines for Implementation of CEQA, 14 California Code of Regulations, Sections 15000 et seq. (the “CEQA Guidelines”); and

**WHEREAS**, on May 9, 2018, the City published a Notice of a Planning Commission Hearing for May 31, 2018 (the “Notice”) in The Business Journal and provided it to interested parties; and

**WHEREAS**, the Notice informed the public and interested parties that the Planning Commission would be considering the following actions (“Project Approvals”), as well as the associated EIR: CUP85-18A11, which request the approval of a conditional use permit amendment, for the Clovis Community Medical Center Expansion; and

**WHEREAS**, on June 4, 2018, the Planning Commission considered testimony and information received at the public hearing and the oral and written reports from City staff, as well as other documents contained in the record of proceedings relating to the Project and EIR, which are maintained at the offices of the City of Clovis Planning and Development Services; and

**WHEREAS**, the Planning Commission has independently reviewed and considered the EIR; and

**WHEREAS**, the Planning Commission has evaluated and considered all comments, written and oral, received from persons who reviewed the Draft EIR and Final EIR, or otherwise commented on the Project; and

**WHEREAS**, the Planning Commission has independently reviewed and considered the Mitigation Monitoring/Reporting Program of the Final EIR.

**NOW, THEREFORE**, the Planning Commission of the City of Clovis adopts the foregoing recitals as true and correct and resolves as follows:

1. Finds that the EIR for the Project is adequate and has been completed in compliance with CEQA and the CEQA Guidelines.
2. Finds and declares that the EIR was presented to the Planning Commission and that the Planning Commission has independently reviewed and considered the information contained in the EIR prior to recommending approval of the Project.
3. Based upon its review of the EIR, finds that the EIR is an adequate assessment of the potentially significant environmental impacts of the Project as described in the EIR, sets forth a reasonable range of alternatives to the Project, and represents the independent judgment of the Planning Commission .
4. Finds that the Final EIR additions, clarifications, amplifications, modifications and other information in response to comments on the Draft EIR are not significant new information as that term is defined under the provisions of CEQA or the CEQA Guidelines because such changes and additional information do not indicate that (i) any new significant environmental impacts not already evaluated would result from the Project; (ii) there is any substantial increase in the severity of any environmental impact from the Project unless mitigation measures are adopted that reduce the impact to a level of insignificance; (iii) any feasible alternatives or mitigation measures considerably different from those previously analyzed in the Draft EIR have been proposed that would lessen significant environmental impacts of the Project but the proponents decline to adopt it. Accordingly, the Planning Commission hereby finds and determines that recirculation of the Final EIR for further public review and comment is not warranted.

5. The Planning Commission has considered all feasible mitigation measures, and has examined potentially feasible alternatives to the Project.
6. Recommends that the City Council certify that the EIR is adequate and has been completed in compliance with CEQA and the CEQA Guidelines.
7. Recommends that the City Council adopt the Mitigation Monitoring/Reporting Program set forth in Final EIR, including the mitigation measures identified therein and as described in the EIR.
8. Directs that the record of these proceedings be contained in the Department of Planning and Development Services located at 1033 5<sup>th</sup> Street, Clovis, CA 93612, and that the custodian of the record be the City Planner, Bryan Araki or other person designated by the Planning and Development Services Director.
9. Recommends that the City Council authorize the Planning and Development Services Director, or his designee, to file a Notice of Determination for the Project in accordance with CEQA and to pay any fees required for such filing, including Department of Fish and Game fees.

**DRAFT  
RESOLUTION 18-\_\_**

**A RESOLUTION OF THE CLOVIS PLANNING COMMISSION APPROVING A CONDITIONAL  
USE PERMIT AMENDMENT FOR THE EXPANSION OF THE CLOVIS COMMUNITY  
MEDICAL CENTER LOCATED AT THE INTERSECTION OF HERNDON AND TEMPERANCE  
AVENUES INCLUDING AN EXPANSION OF THE MAIN HOSPITAL CAMPUS, COMMERCIAL  
DEVELOPMENT ON THE WEST SIDE OF TEMPERANCE AVENUE, AND OFFICE/MEDICAL  
DEVELOPMENT ON THE SOUTH SIDE OF HERNDON AVENUE**

**WHEREAS**, the project proponent, Clovis Community Medical Center, located at 2755 Herndon Avenue, Clovis, CA 93619, has applied for a conditional use permit amendment, CUP85-18A11; and

**WHEREAS**, this is a request is to approve a conditional use permit amendment for a the expansion of the Clovis Community Medical Center Campus located on the north and south sides of Herndon Avenue and east and west sides of Temperance Avenue, in the City of Clovis, Fresno County, California; and

**WHEREAS**, a public notice was mailed to area residents within 600 feet of said property boundaries twenty-one days prior to said hearing; and

**WHEREAS**, in compliance with the California Environmental Quality Act, the Draft EIR was available for public review and comment from February 16, 2018, to April 6, 2018; and

**WHEREAS**, a duly noticed hearing was held on May 31, 2018; and

**WHEREAS**, the proposed conditional use permit CUP85-18A11 was assessed under the provisions of the California Environmental Quality Act (CEQA) and the potential effects on the environment were considered by the Planning Commission, together with comments received and public comments, and the entire public record was reviewed; and

**WHEREAS**, staff does recommend adoption of a Program Environmental Impact Report for CUP85-18A11; and

**WHEREAS**, the Commission, has reviewed and considered the staff report and all written materials submitted in connection with the request including the conditions attached as Exhibit "A" to this resolution and incorporated herein by this reference, and hearing and considering the testimony presented during the public hearing; and

**WHEREAS**, after hearing substantial evidence in the record the Commission, finds as follows:

1. The proposed use is conditionally allowed within, and would not impair the integrity and character of, the subject zoning district and is in compliance with all of the applicable provisions of this Development Code;
2. The proposed use is consistent with the General Plan and any applicable specific plan;

3. The design, location, size, and operating characteristics of the proposed use are compatible with the existing and future land uses and would not create significant noise, traffic, or other conditions or situations that may be objectionable or detrimental to other allowed uses operating nearby or adverse to the public interest, health, safety, convenience, or welfare of the City;
4. The subject parcel is physically suitable in size and shape for the type and density/intensity of use being proposed;
5. There are adequate provisions for public access, water, sanitation, and public utilities and services to ensure that the proposed use would not be detrimental to public health and safety; and
6. That the Project has been evaluated according to CEQA guidelines and an EIR has been prepared for the Project pursuant to the California Environmental Quality Act ("CEQA"), including a Mitigation Monitoring/Reporting Plan.

**WHEREAS**, the record of proceedings is contained in the Department of Planning and Development Services Department located at 1033 Fifth Street, Clovis, California 93612, and the custodian of record is the Deputy City Planner.

**NOW, THEREFORE, BE IT FURTHER RESOLVED** that the Clovis Planning Commission does approve CUP85-18A11, subject to the attached conditions labeled Exhibit "A."
